➢ iAmX Software Explained –

➢ (Introduction):

- iAmX is retail management software that allows us to manage all retailing functions, such as Point of Sale (POS), Customer Relationship Management (CRM), Inventory Management, Reporting and Analytics, and many other features, all under one platform
- iAmX consists of two major modules,
  - **Store by iAmX:** Store by iAmX is an Organization/Store, role-based management software suite, where the customer gets access to the organization, warehouse/store management, inventory management, taxes, revenue, detailed analytics, reports in one platform.
  - **Point of sale (POS) by iAmX:** In this module, the employees will work on aspects like collecting customer data, sale of product by giving descriptive information, managing payments, managing inventory, generating invoices & receipts and more functions

➢ SIGNING UP PROCESS:

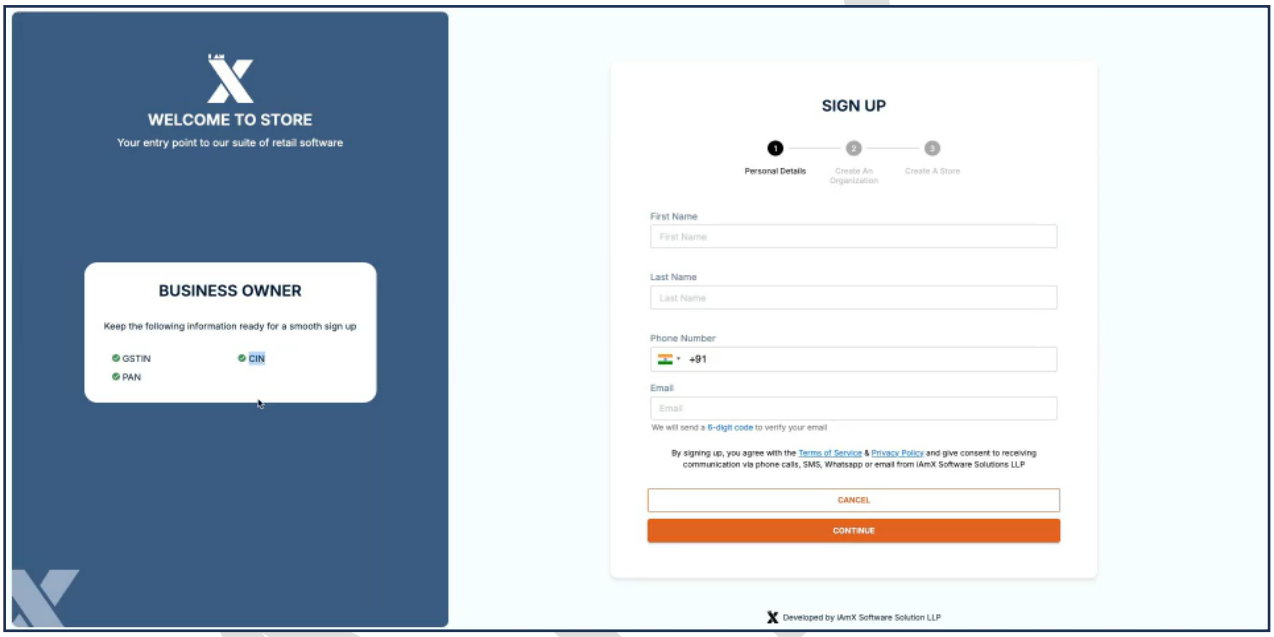
- Basic login: iAmX users can easily log in to iAmX Store by using the below website link Click here
- A Business owner or an employee of iAmX can access the iAmX store but with some limitations by accepting the privacy policy and terms and conditions of iAmX.
- Verification code is important because it is the source for a user to log into the iAmX store.
- Here business owners should maintain some important details like GSTIN, CIN, and PAN ID to get access to the iAmX software suite.
- Three major steps involved in sign up process

  Ⅰ. Entering personal details

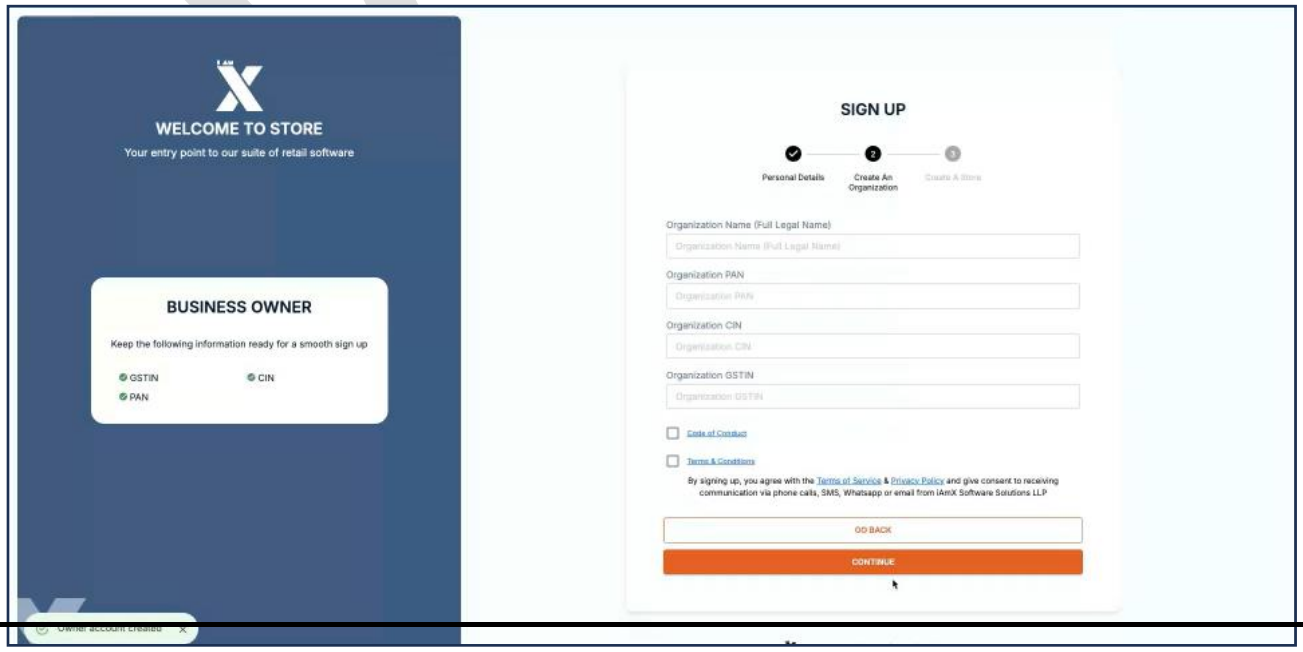
  Ⅱ. Creating organization

Ⅲ. Creating store

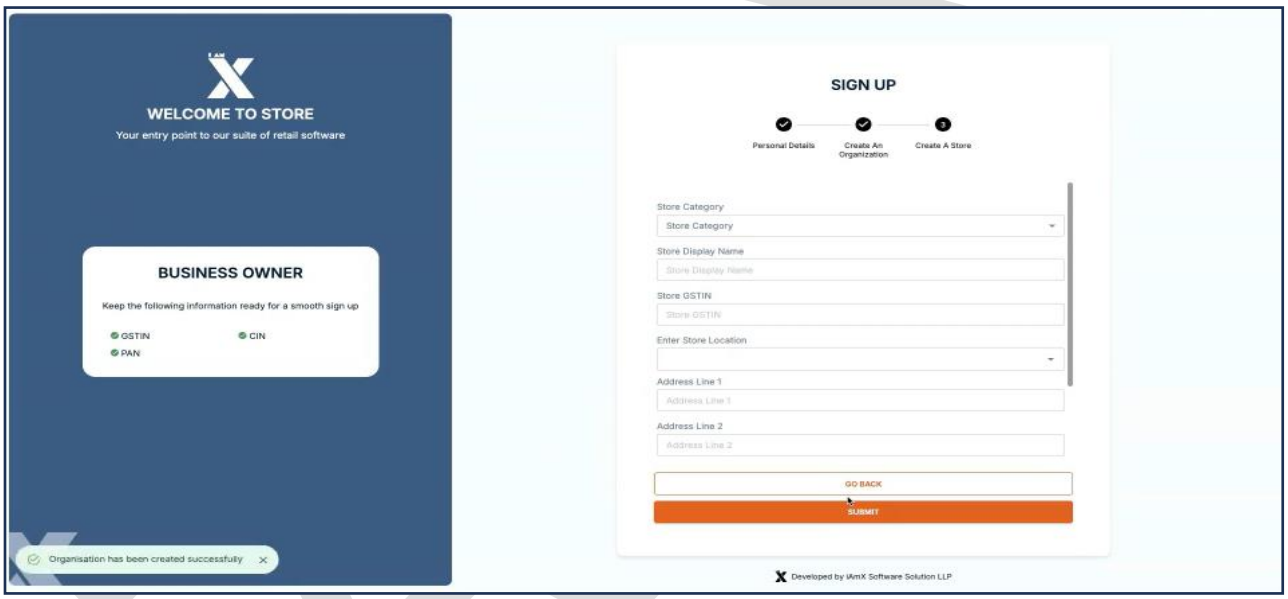
- **Entering personal details:** This is step 1 of filling in general details by the user. General details like GSTIN, CIN, and PAN number will be asked and a verification code will be sent to the mentioned email ID, code is verified, and only then the process will move to the next step.



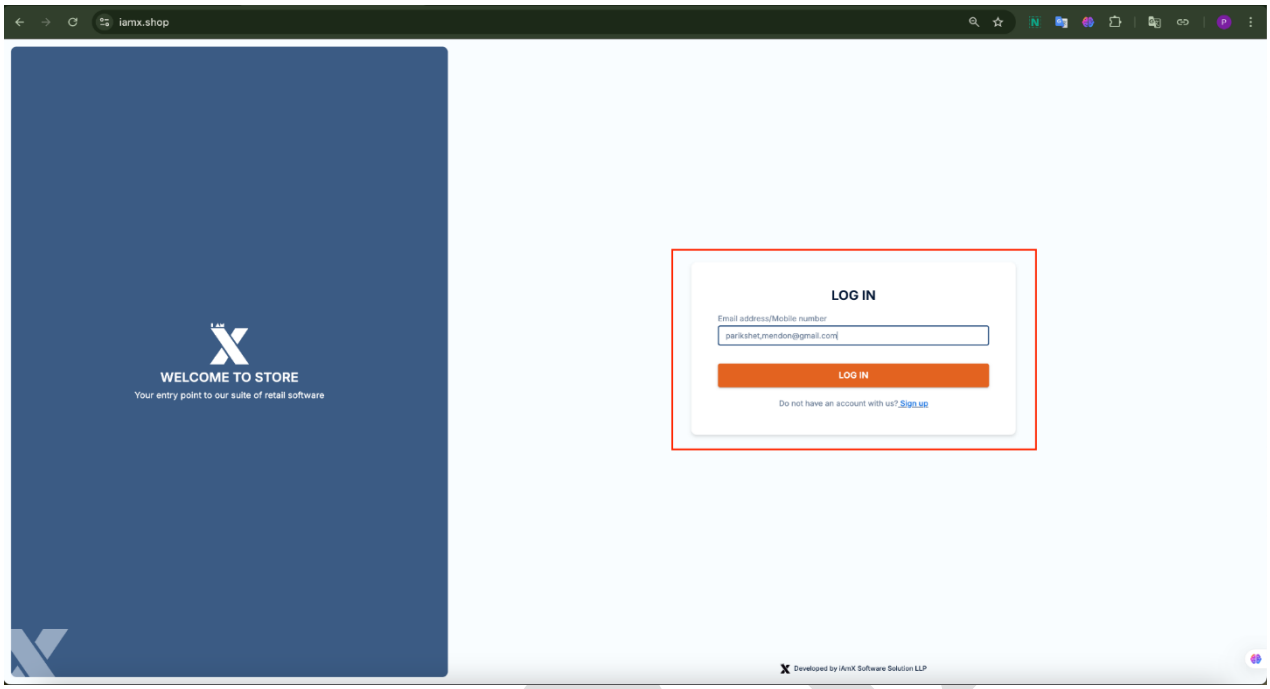
- **Creating organization:** Step 2 which will be filled in by the business owner to create an organization, in this particular step organization details like Organization GSTIN, CIN, and PAN are asked of the user, by filling in these details and accepting the code of conduct then it allows the user to continue for further step.



- **Creating store:** This is the final step for creating an account in iAmX software, general details like Store Name, Category, GSTIN, Location (will auto-populate with Address line 1, City, State, PIN, etc, on entering the first address line) and after filling it user can successfully login to the iAmX software suite.



.



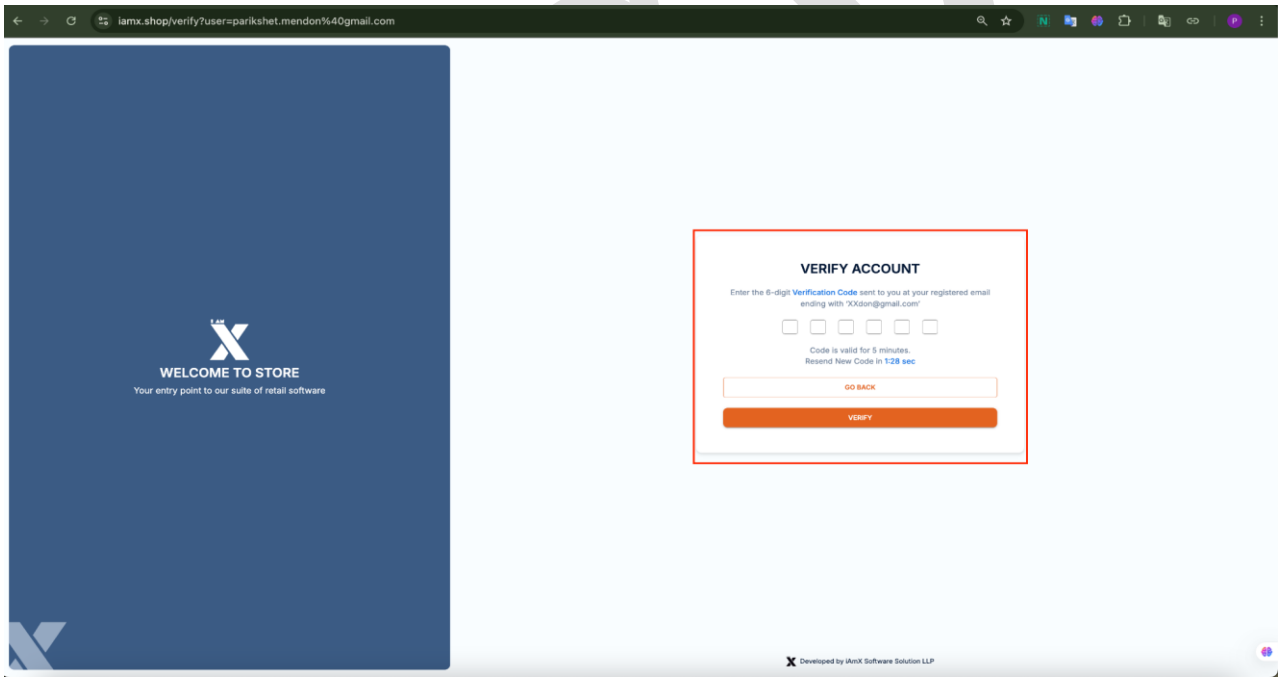
LOGIN FLOW

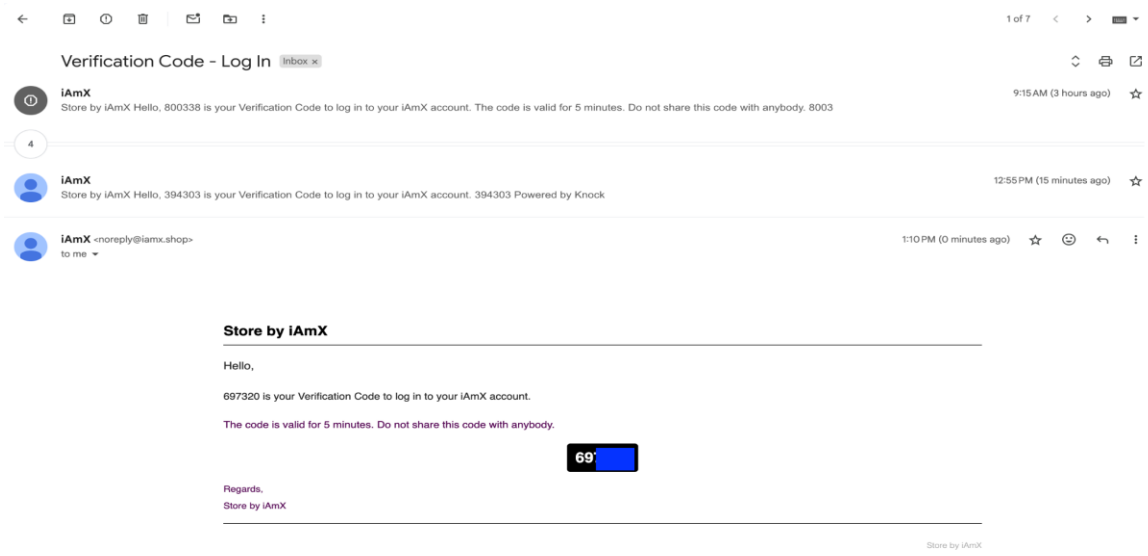
Topic 1: - For Organizational Store Access

URL to Login: - Click Here

Email ID: - Enter your email ID to access your account

- A 6-digit **OTP** will be sent to your email to verify your account
- OTPs add an extra layer of security beyond just a username and password. This is known as two-factor authentication (2FA).
- Even if someone manages to steal your password, they won't be able to log in without access to your OTP
- iAmX enhances user security by requiring verification codes. This process confirms user identity, ensuring only authorized individuals access accounts and safeguarding their data.





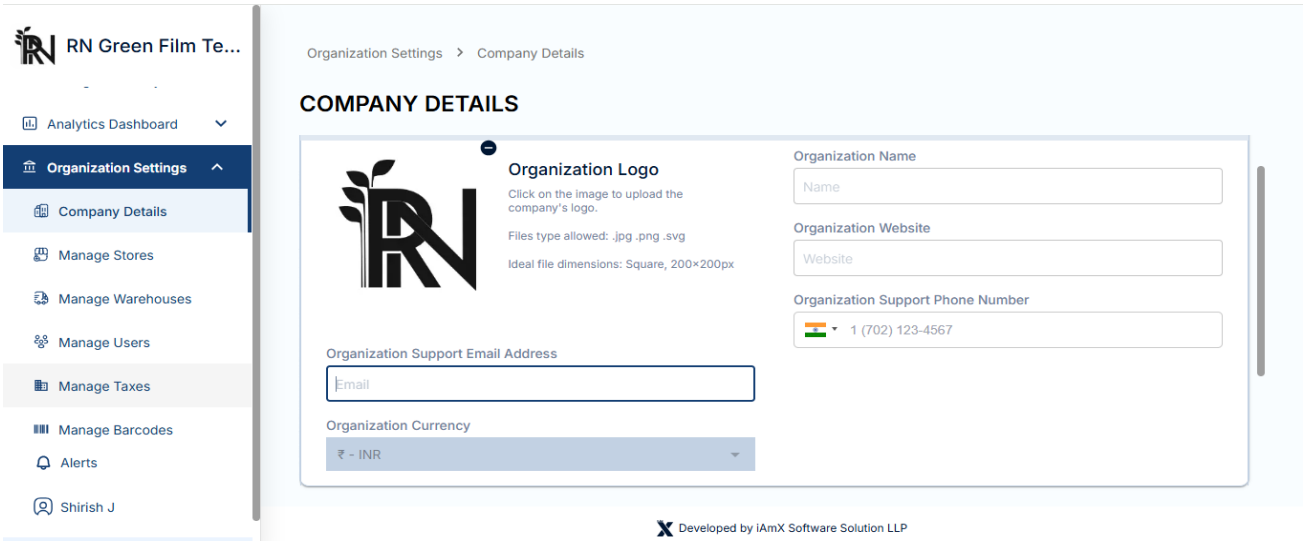
- This is how the verification code will be sent to the user's registered email address
- Once the user receives the code, they can use it to verify their account
- This interface will be displayed immediately after the user successfully logs in

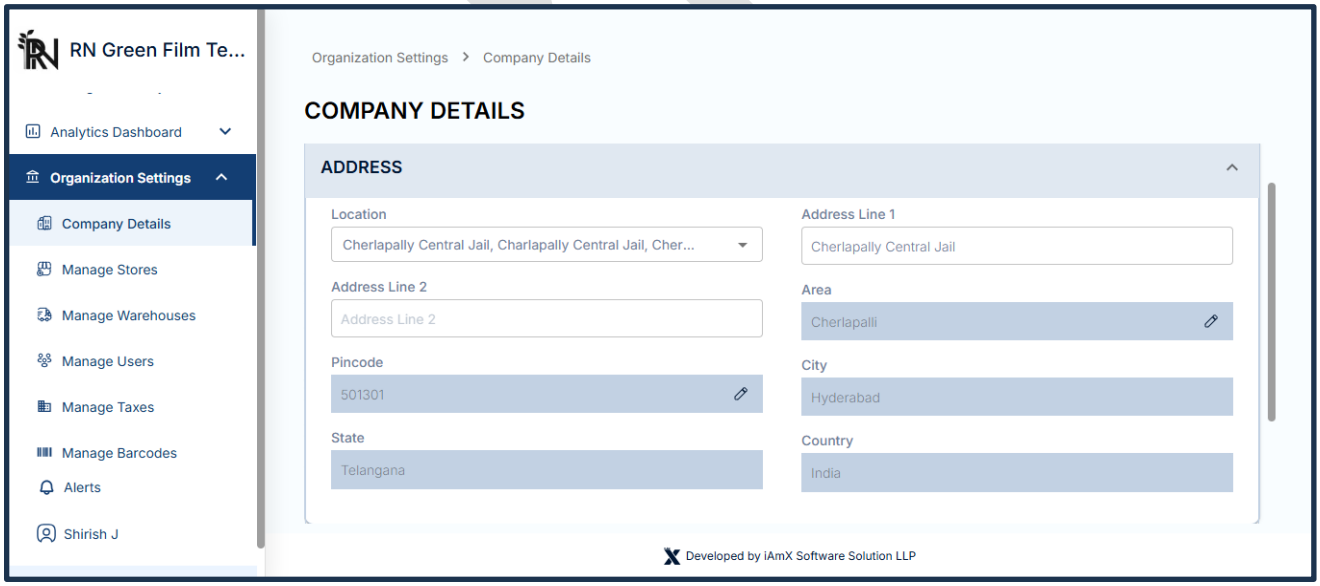
Chapter 1: Organization Settings

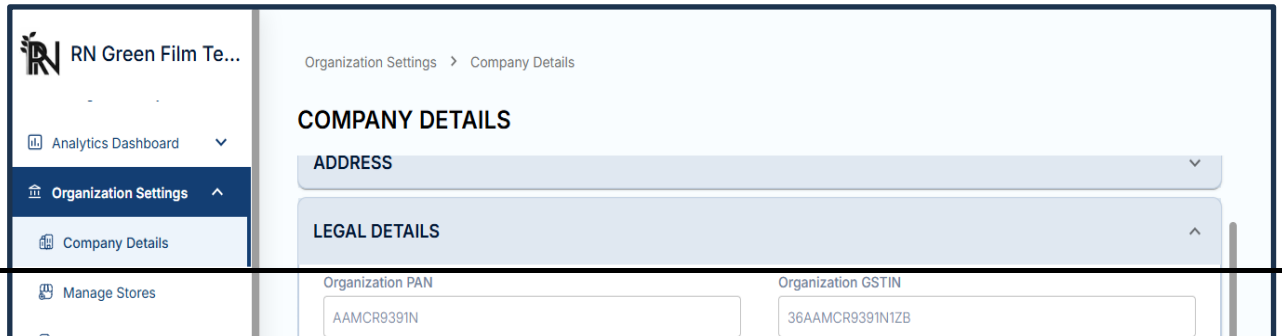
➢ Company details:

- The Company Details section allows users to access all relevant information about their business
- The Company Details section includes the organization's name, mobile number, email address, official website, and address
- When entering an address, the user has to simply provide the first line, the system will automatically populate the remaining address details
- Users are also required to provide legal details about their organization, such as their PAN, CIN, and GSTIN

iAmX Software Solutions LLP





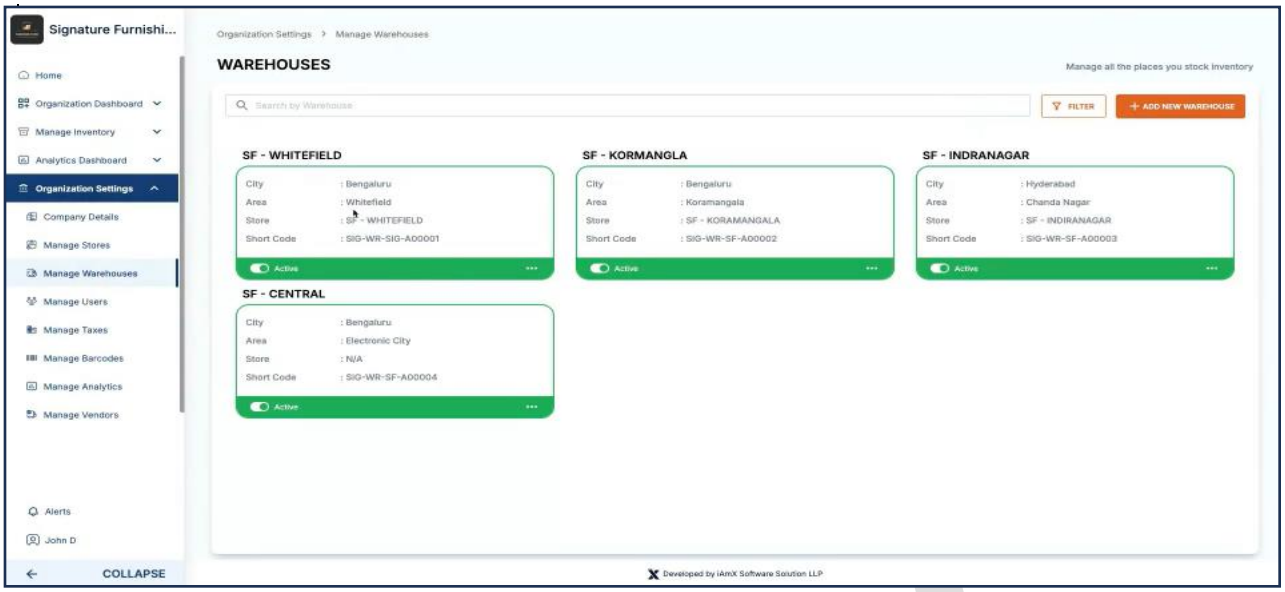


➢ Manage Warehouse:

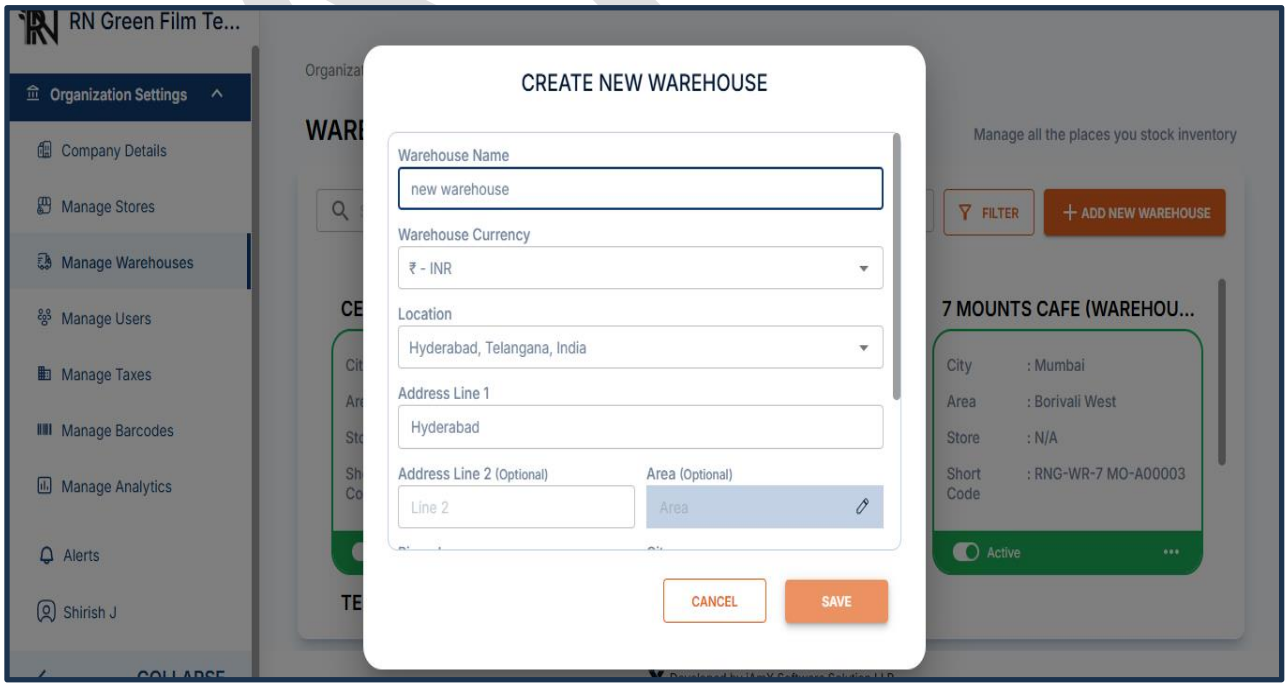
- The warehouse will mainly focus on efficient storage, management, and distribution of large quantities of inventory
- Holds a much larger and broader range of inventory, serving as the central supply source for other stores
- **Inventory control**: Tracking stock levels, receiving shipments, and managing stock movements.
- **Warehouse management**: Optimizing storage space, managing warehouse operations, and tracking inventory location
- iAmX provides users with the capability to establish an unlimited number of warehouses to accommodate their business requirements

➢ How to Create a Warehouse

- To create a new warehouse, users should access the organization settings and select the Manage Warehouse option
- Users can easily create new warehouses by clicking the 'Add New Warehouse' button. They can create as many warehouses as required



- Creating a new warehouse is simple. The user has to provide the warehouse name, currency, and location then the system will automatically fill in the rest of the address details, making it quick and easy to set up your warehouse
- Upon completion of filling in details and selection of the 'Save' button, the warehouse will be created. This process can be repeated as frequently as necessary to accommodate the user's requirements

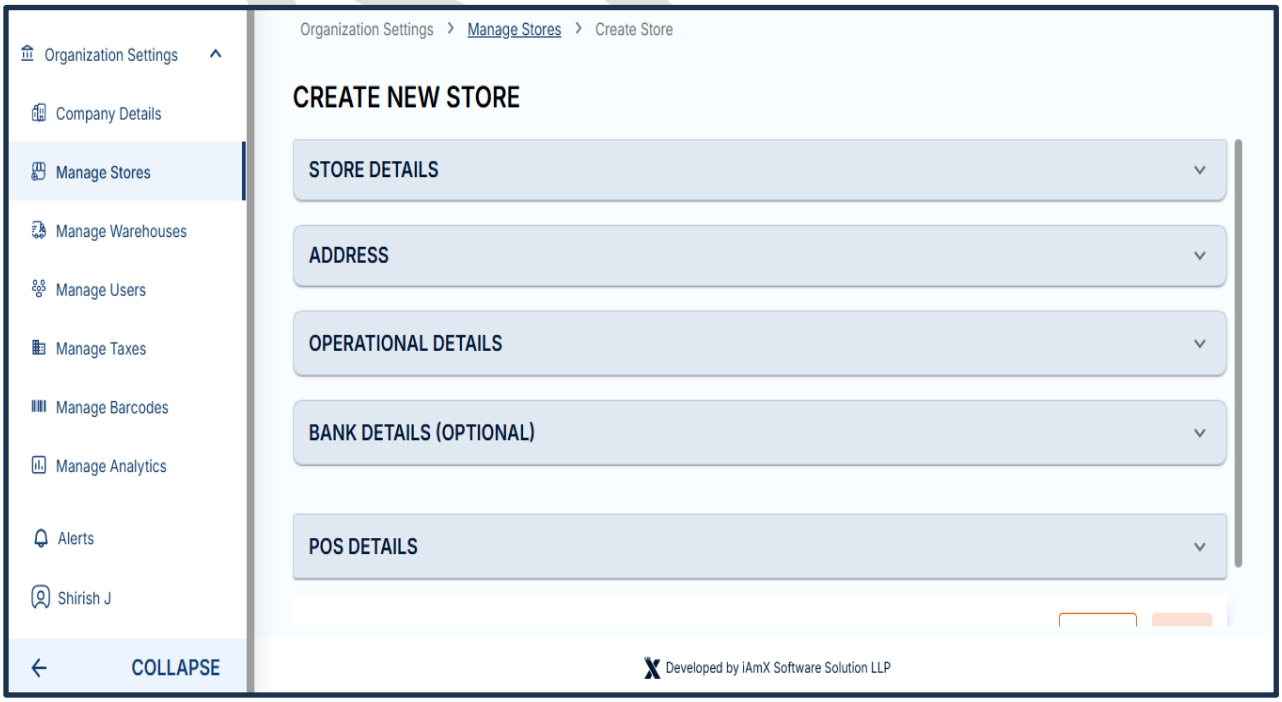


➢ Manage Stores:

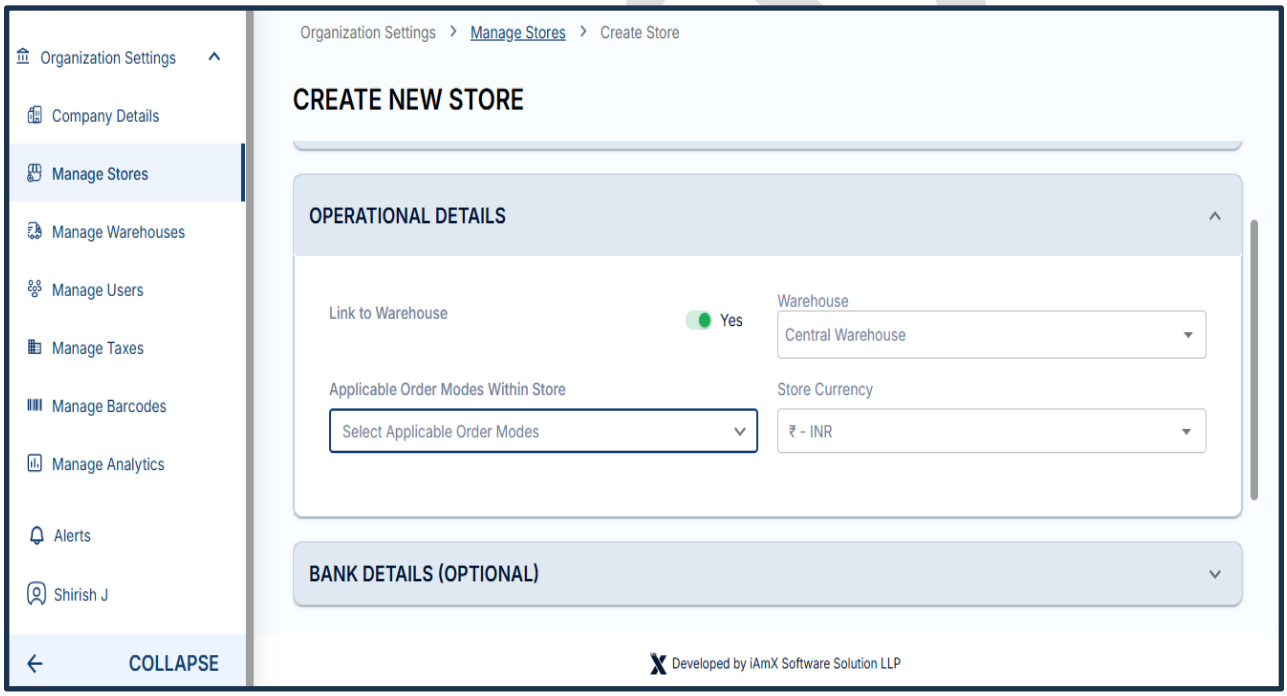
- The store holds a smaller, curated selection of inventory to meet immediate customer demand and focus on direct interaction with customers and sales transactions
- There are three major functionalities of the store in iAmX
  - ➢ **Point of Sale (POS) transactions**: Processing & management of sales
  - ➢ **Customer management**: Tracking customer information and purchase history
  - ➢ **Local inventory management**: Tracking stock levels and triggering replenishment orders

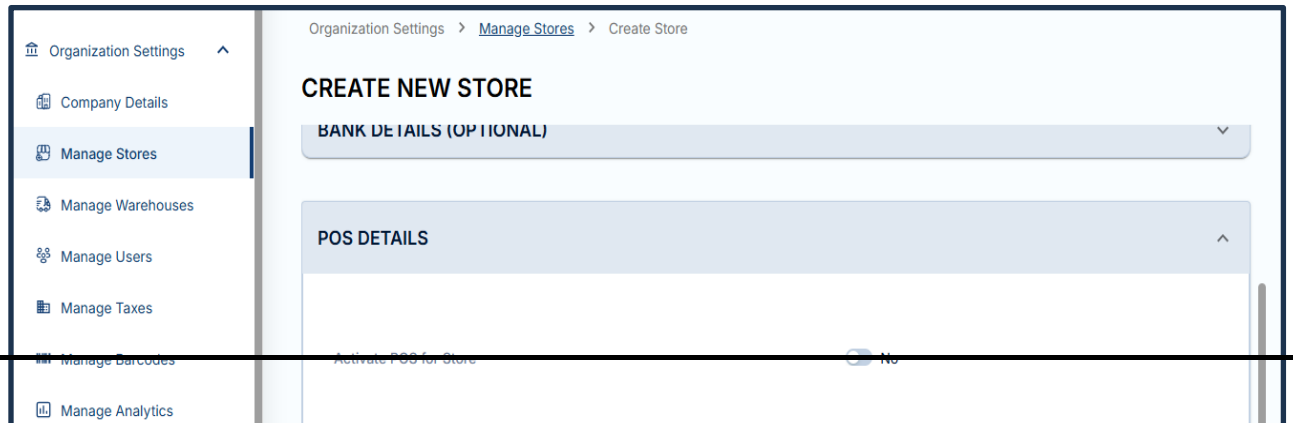
➢ How to Create a Store

- The Users can create stores as per their subscribed plan – Pricing Matrix
- Users can go the Organization setting >Manage Stores> Add a new store
- This interface will be displayed after the user clicks the specified buttons within the system



- User has to fill in the details like Store's name, mobile number, E-mail, GSTIN, etc
- Users are required to provide the store's address. However, only the location needs to be manually entered. The system will automatically populate the remaining address fields
- The store creation process requires users to furnish certain operational details, including the selection of the order mode (At-counter, Pick-up, Delivery) and the provision of bank account information.
- The business owner holds the authority to activate the Point of Sale (POS) option by clicking 'Save' button the store will be created successfully and choose between (UPI, Cash, Credit / Debit Card) options





➢ How to link a Store & Warehouse

- **IMP** - The store won't list any products for sale until it's connected to a warehouse. Once connected, the store itself acts as a warehouse
- The primary reason is to maintain accurate stock levels
- Linking stores to warehouses helps prevent discrepancies between what the system thinks is in stock and what's available. This is essential for preventing lost sales and maintaining transparency
- Linking stores and warehouses provides a holistic view of inventory and sales across all locations, allowing users to make better strategic decisions
- A store has to be linked to one warehouse to ensure the smooth functioning and analytics around it

➢ Managing users:

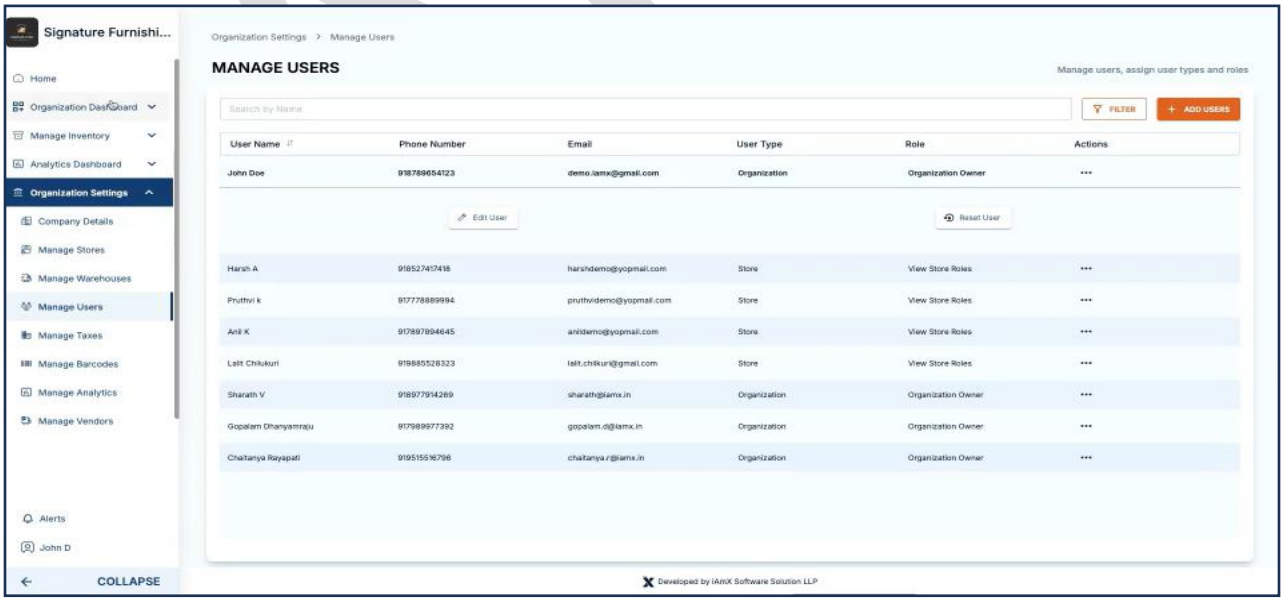
- Specific user control access is set up in iAmX, only specific users can access specific pages in iAmX.

Ⅰ : View Store level

Ⅱ : View Organization level

- **<u>View Store Level:</u>** The users in view store roles are primarily concerned with store-level access. These users are considered store admins or store managers who will manage all the functions and operations up to store levels only. They won't be able to utilize the organization's details
- **<u>View Organization Level:</u>** These organization owners are concerned with the overall organization management. Users with this role will have access to data, reports, and functionalities across multiple stores or locations. Organization Role is associated with higher-level management and decision-making. The organization-level view contains all the store orders, inventory movement, purchases, sales, customer details, and products across all the stores

- User control access in iAmX is settled up to prevent unauthorized access to sensitive data like financial records, customer information, or inventory details
- By implementing this feature in IAMX, users or employees will only see the information and features that are relevant to their tasks
- Ensures compliance with regulations like data privacy laws (e.g. GDPR)
- Tracking employee actions within the system helps to identify the issues and prevent fraud - Click Here to learn more

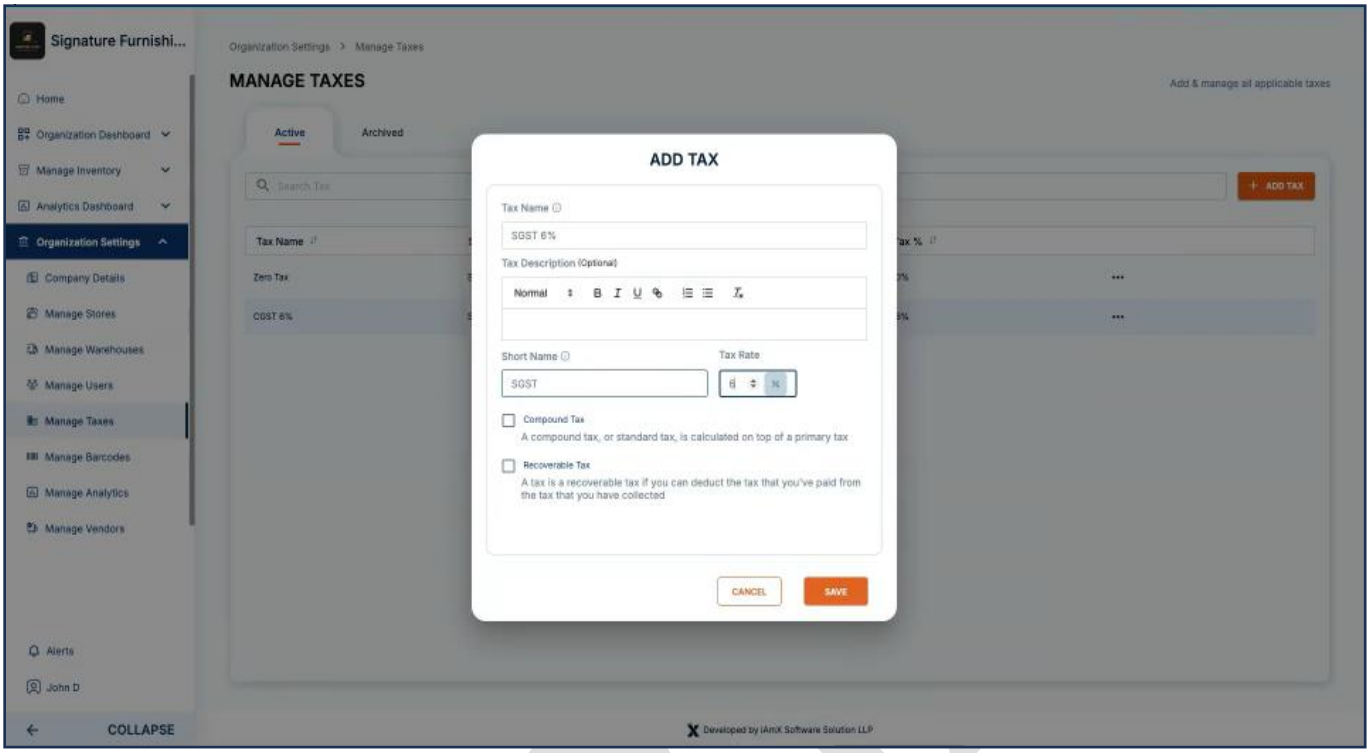


➢ Managing Taxes:

- The iAmX allows users to set up different tax rates based on location (state, country, city), product type (some items might be under tax-exemption), or customer type (e.g. tax-exempt organizations) - **Need to verify**
- Taxes like CGST, SGST, and IGST can be set up by the user
- For example, CGST (6%) and SGST (6%) will be set up to the product category just to increase the levels of product management
- Store managers have full control over how taxes are configured for their store
- Users have to apply the taxes for all product categories just to categorize the products at the store level
- Instead of manually calculating taxes for each transaction, iAmX automatically

  applies the correct rate based on the product.iAmX generates detailed report that summarize sales and taxes collected, categorized by product and tax rate.

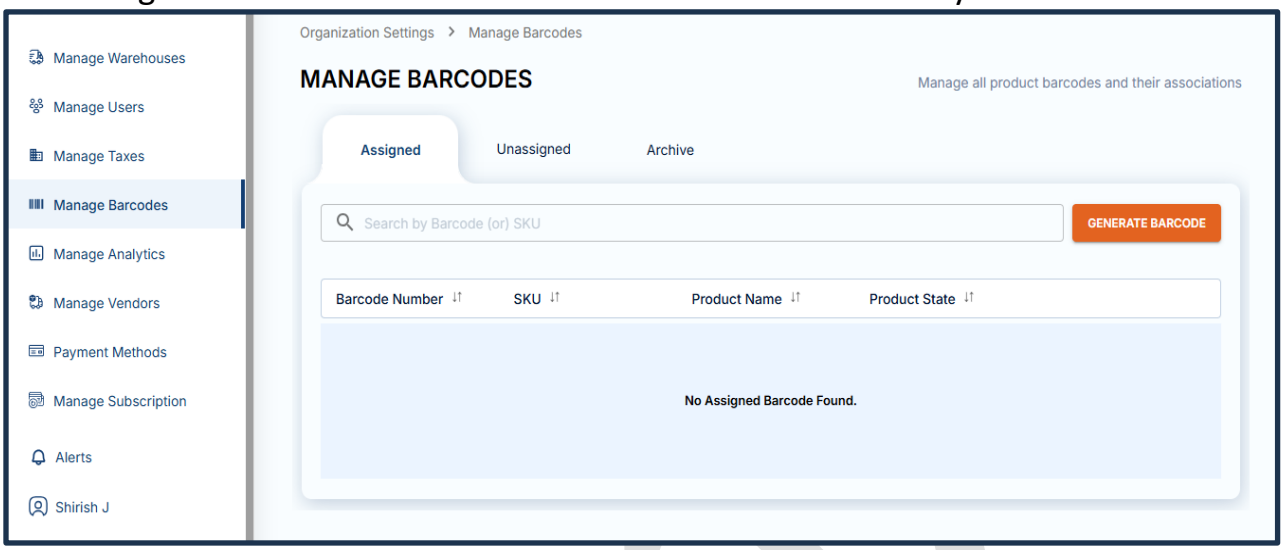
iAmX



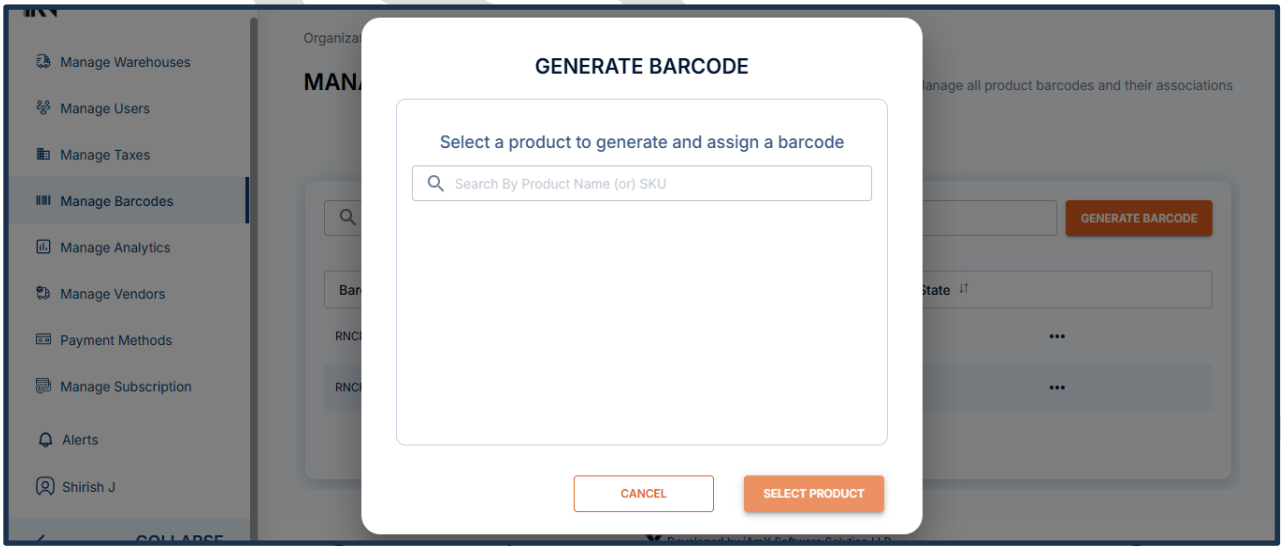
➢ Barcode-functionality:

- Each product in iAmX is assigned a unique barcode. This barcode contains information about the product, such as its name, SKU (Stock Keeping Unit), and other relevant details

- Users can easily identify products using the barcode functionality, regardless of the device they're using (phone, laptop, or tabs)
- Using cameras also users can use this barcode functionality.

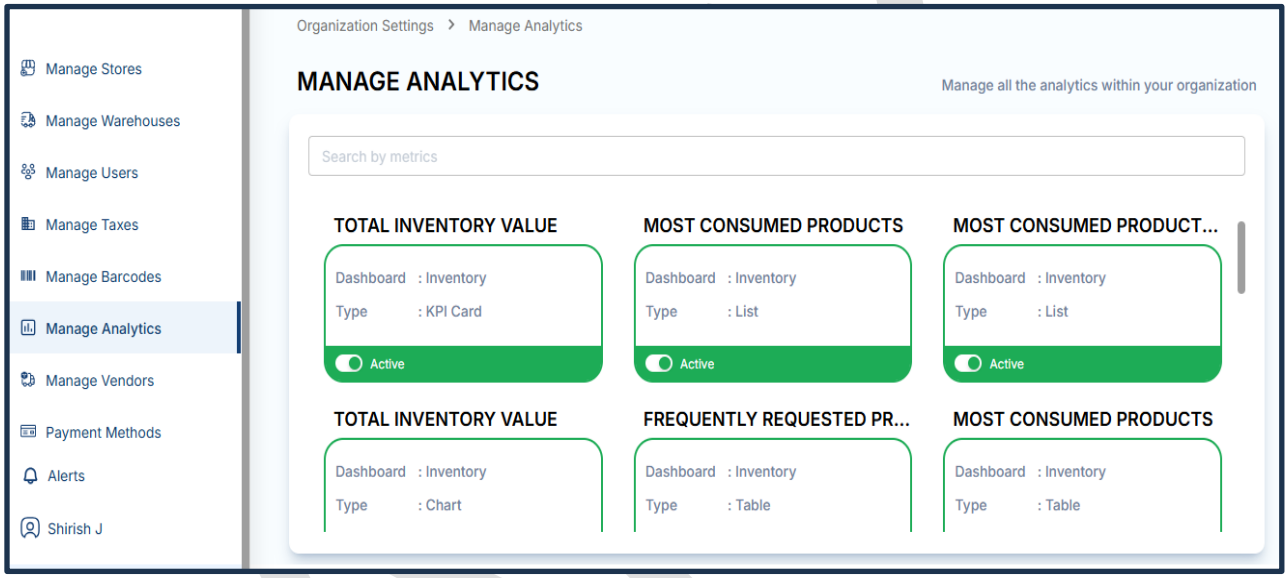


- The Manage Barcode section displays assigned, unassigned, and archived barcodes, providing a clear overview of all barcodes created for products
- User can also generate the Barcodes for the product in the iAmX system and track its details from time to time, because it will be updated in the organization settings > Manage Barcodes > Generate Barcode, by selecting a product and by pressing the Generate Barcode option, Barcode will be generated successfully



to the store

- iAmX Analyze sales data to identify top-selling products, slow-moving products, and seasonal trends
- Monitor inventory levels, track stock available in store, and identify potential stockouts or overstocks
- Whereas reporting will produce the reports accordingly with analytics operations like generating customer segments, buying trends, and popular products, comparing sales across different stores, and tracking sales targets, inventory turnover, and stock value of iAmX

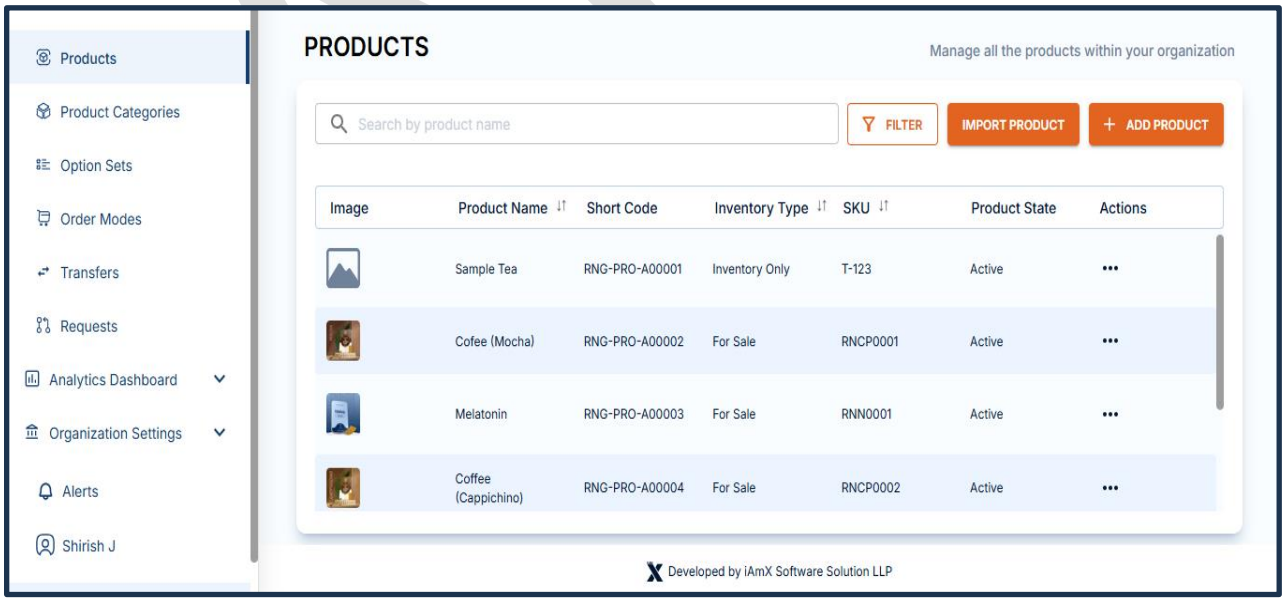


- The Manage Analytics section provides comprehensive data on products, POS, inventory, orders, and transactions
- The users are accessible through Organization Settings > Manage Analytics, this feature allows them to easily track specific values presented in KPI cards, charts, or lists

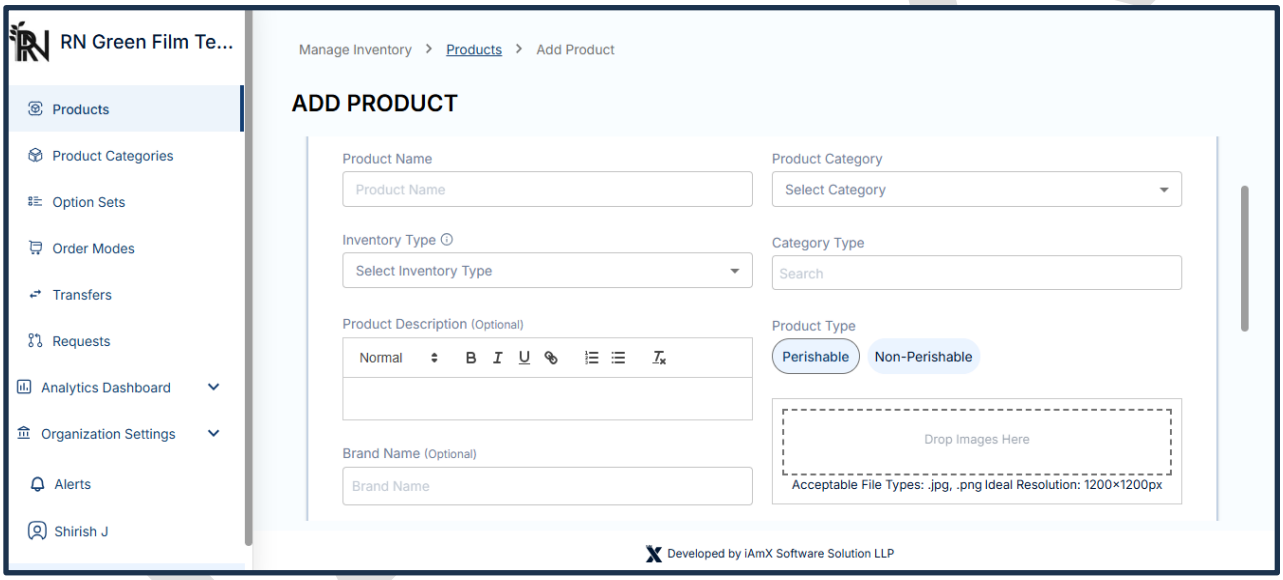
➢ Chapter 2: Manage Inventory

➢ Products:

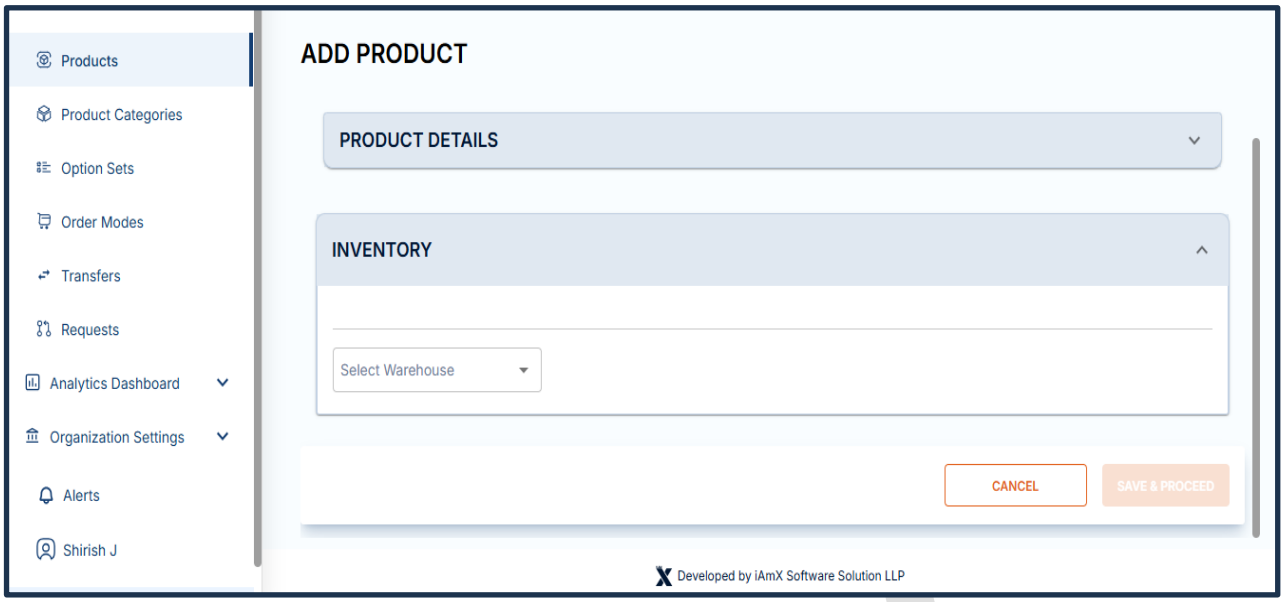
- The "Product" option in iAmX is the central hub for managing all aspects of products
- It's a place where users can create, edit, and organize the items they sell
- Here's a breakdown of iAmX product management functionality
- **Product Creation:** Product creation iAmX involves adding new items to your system for inventory tracking, sales processing, and overall management. This typically includes entering basic product information like name, SKU, category, and brand, setting pricing and costs, and managing inventory details. Users can also usually upload images, assign barcodes, apply tax codes, specify suppliers, and add any other relevant details or specifications. Finally, users save the product information and potentially activate it for sale, ensuring data accuracy and consistency throughout the process



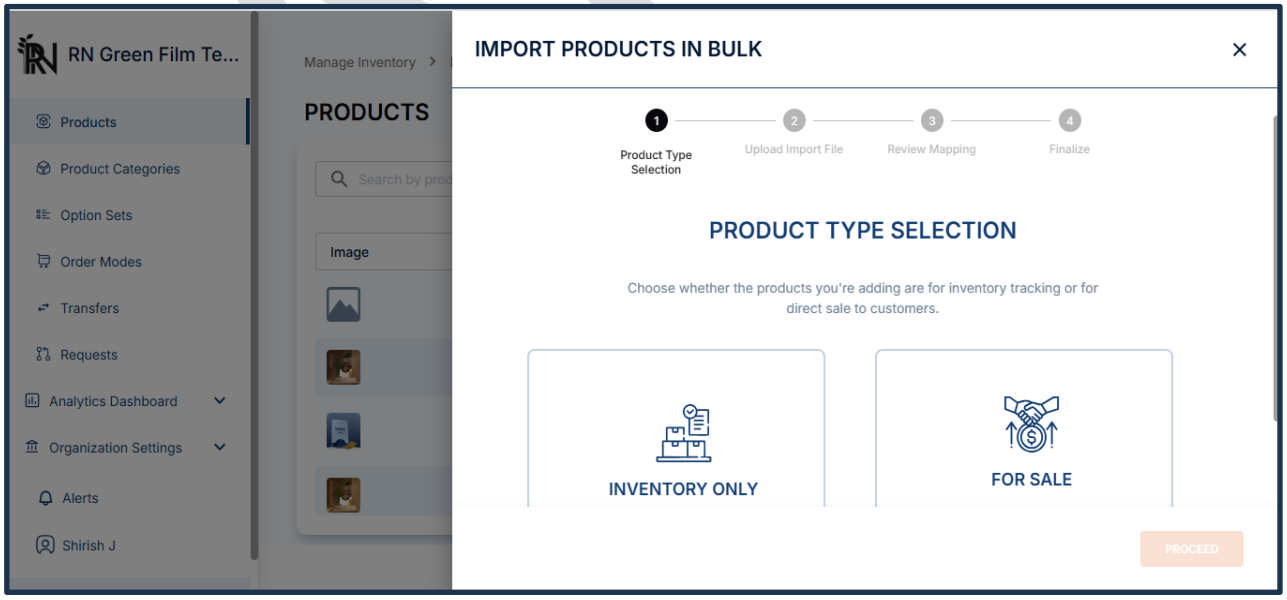
- **Product Management:** Product management iAmX is the continuous upkeep of the user's product catalog. It starts with easily accessing and searching for products. Then, they can edit any detail, from basic information and pricing to inventory settings. Bulk updates save time, and managing product status (active/inactive) helps control their offerings. The organization through categories and groupings improves discoverability. Crucially, product management integrates with other systems like POS, e-commerce, and inventory. Regular maintenance, including price checks and inventory verification, ensures accuracy and a smooth customer experience
- Users can also add the product according their need and make use of it, for that user must select the option Manage inventory > Products > Add product.



- To add products to their inventory, users must complete a product addition form. This form collects essential information required for processing and managing new inventory items
- Common product details include the product name, category, type, and brand name (if known)
- Users can add product images for clarity and use barcodes for quick product entry via camera scanning



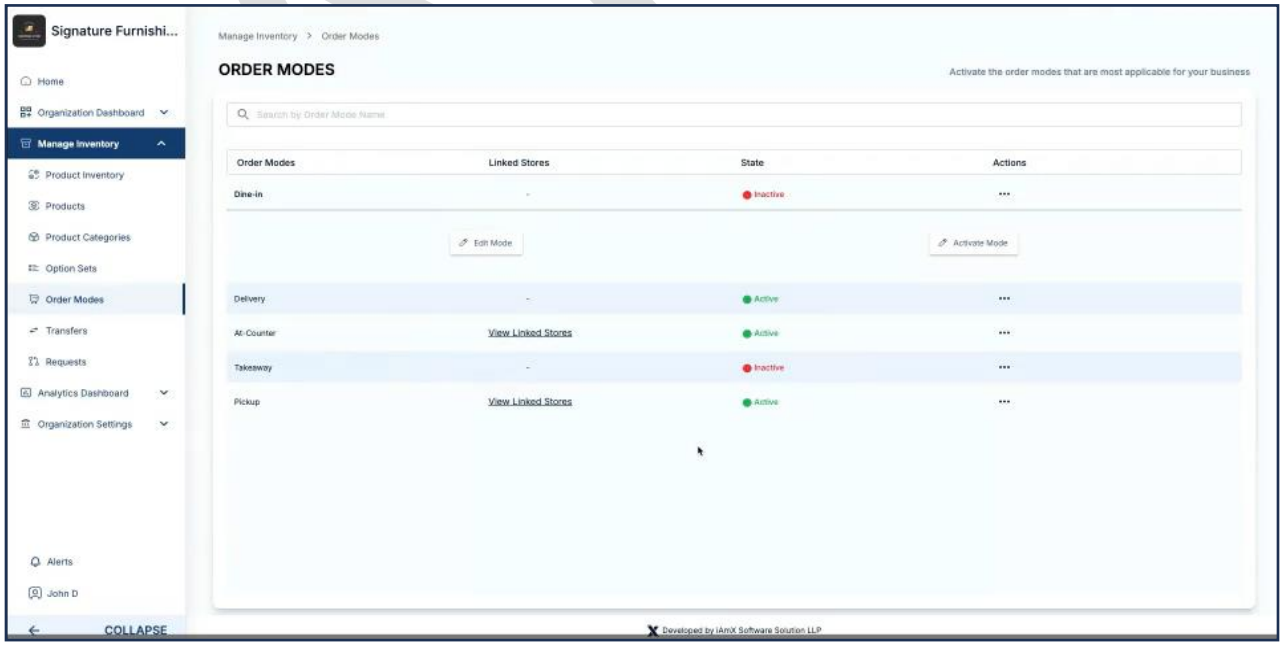
- Users retain the ability to modify product details and associated tax information as required
- Users are authorized to perform the following actions: product editing and viewing of inventory inflow and outflow history logs
- Retailers can add inventory in bulk amount and link stores to their corresponding warehouses



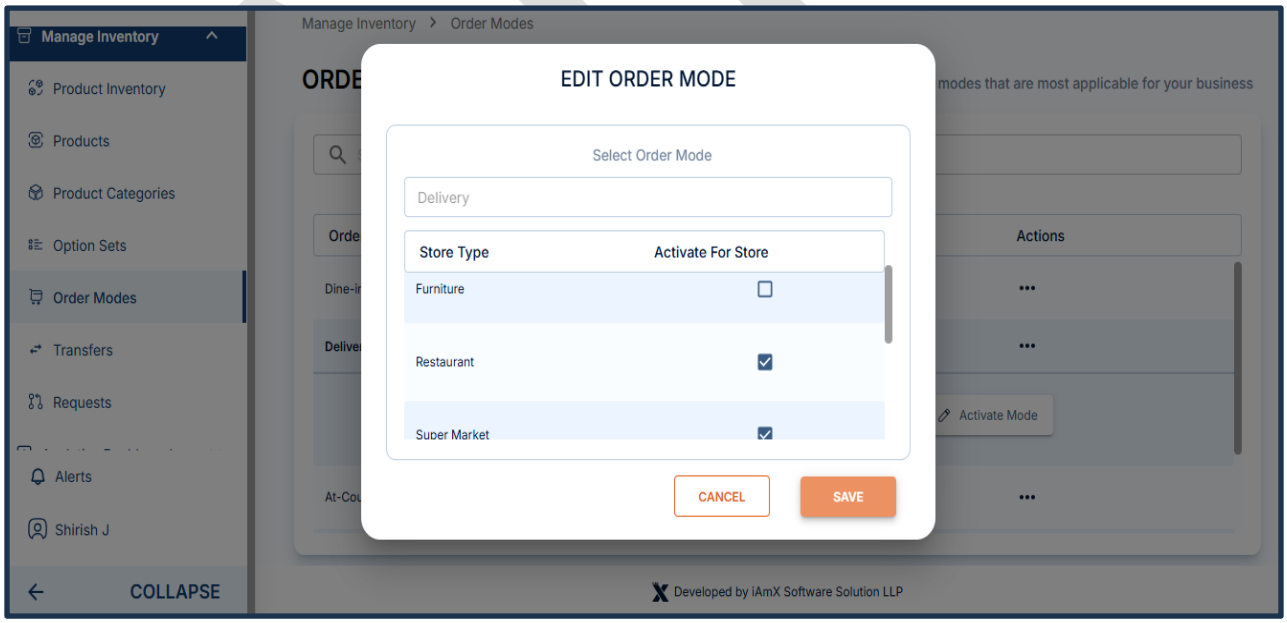
➢ Order-Modes:

- Order modes in iAmX software define the various methods customers use to place orders, impacting how those orders are processed and fulfilled.
- Order modes are made in such a way that represent the various methods a customer can use to purchase goods from iAmX.
- There are 5 major order modes built up in iAmX for accessibility of a user to their corresponding orders.
- They are mentioned below:

Order mode type	Status
Delivery	Active
Take away	Active
Pickup	Active
Dine-in	In-Active (Activating soon)
At-counter	Active

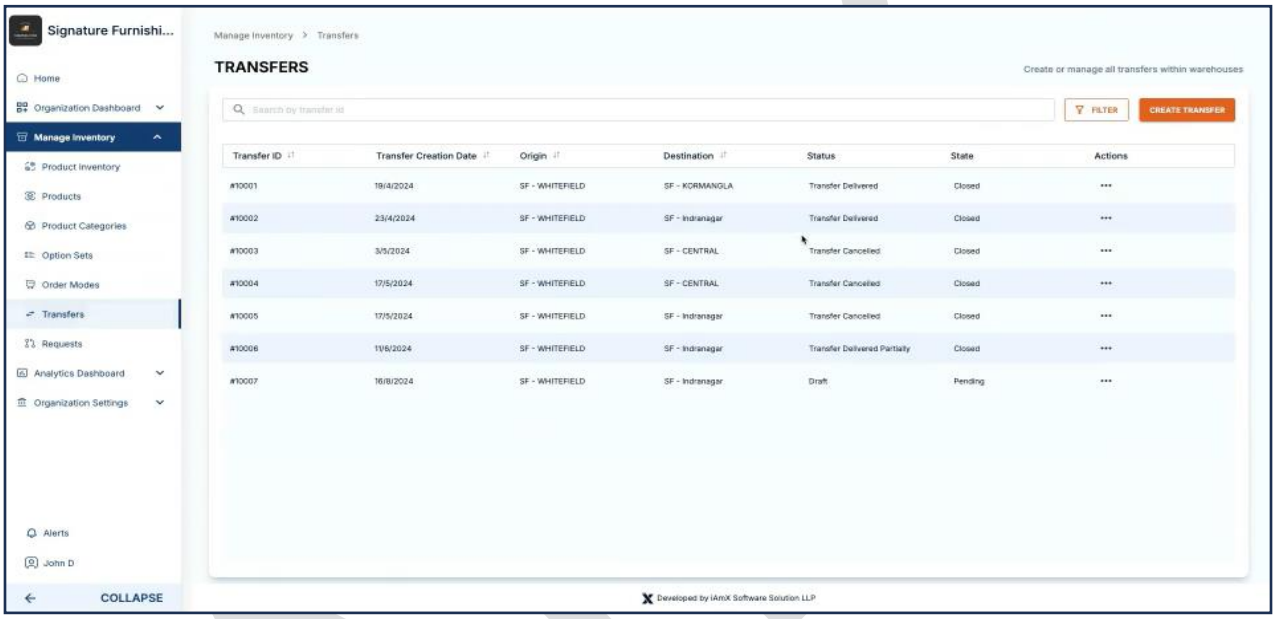


- When creating a new order, the user selects the relevant order mode (delivery, at-counter, pickup), user's choice then dictates the subsequent steps in the order process
- Users can easily assign these order modes to any store available according to their corresponding business
- Users usually have the flexibility to choose from a predefined set of order modes and assign them to their stores. The ability to create an entirely new order mode type is not available in all systems
- At-counter, Delivery, Take-Away and Pickup are the only order modes which are currently active in status, whereas Dine-In order mode will be activated soon
- Users retain the ability to modify order modes in accordance with their specific business requirements
- Users have full control over their order modes, with the option to activate or deactivate them as necessary
- Upon completion of the aforementioned steps and subsequent selection of the 'Save' button, the order mode functionality will be successfully modified

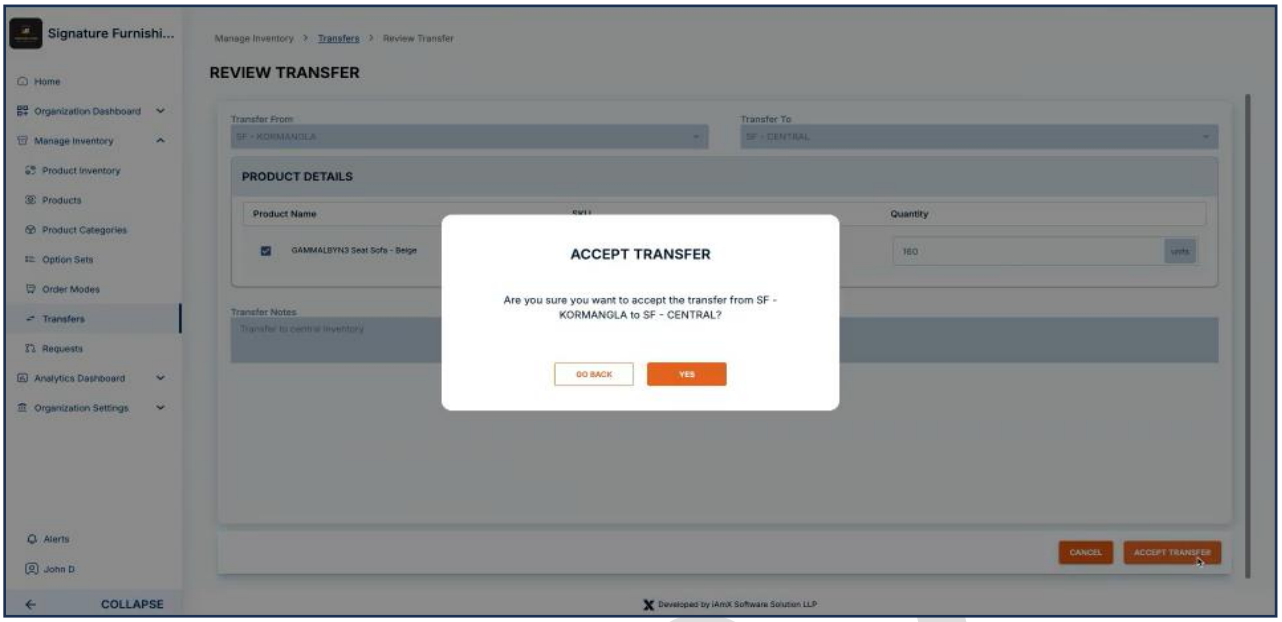


➢ Transfers:

- Transfers are a primary and important function of IAMX, which allows products to be transferred from one to another warehouses.
- Store-to-store, warehouse-to-store and store-to-warehouse transfers are the beneficial features of iAmX.

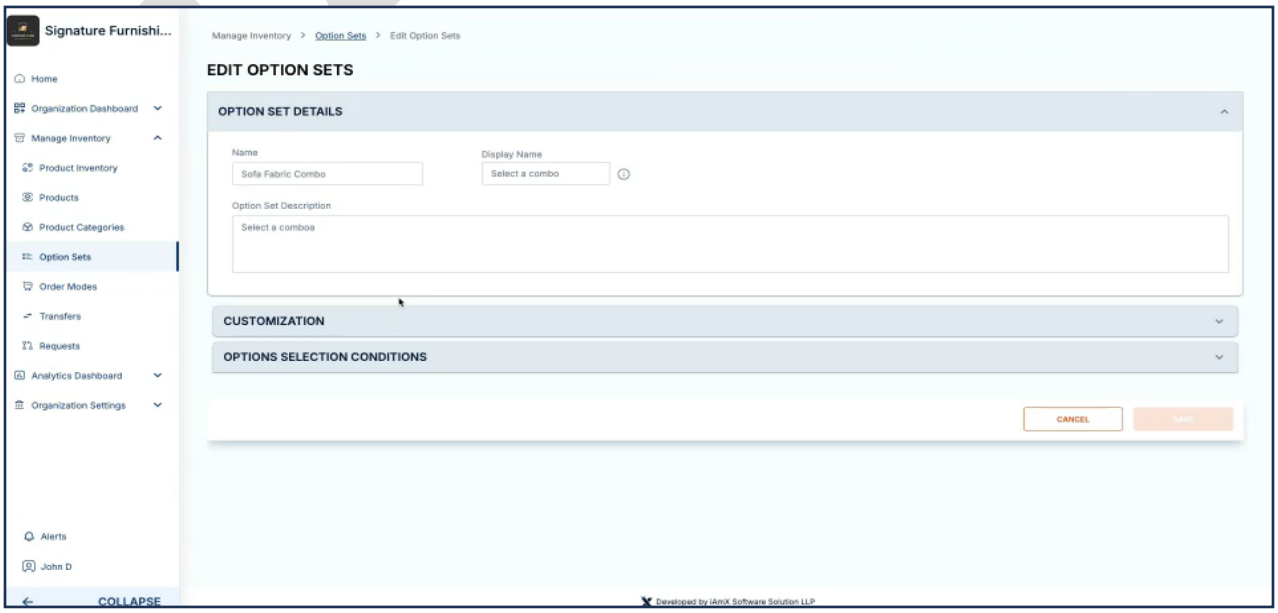


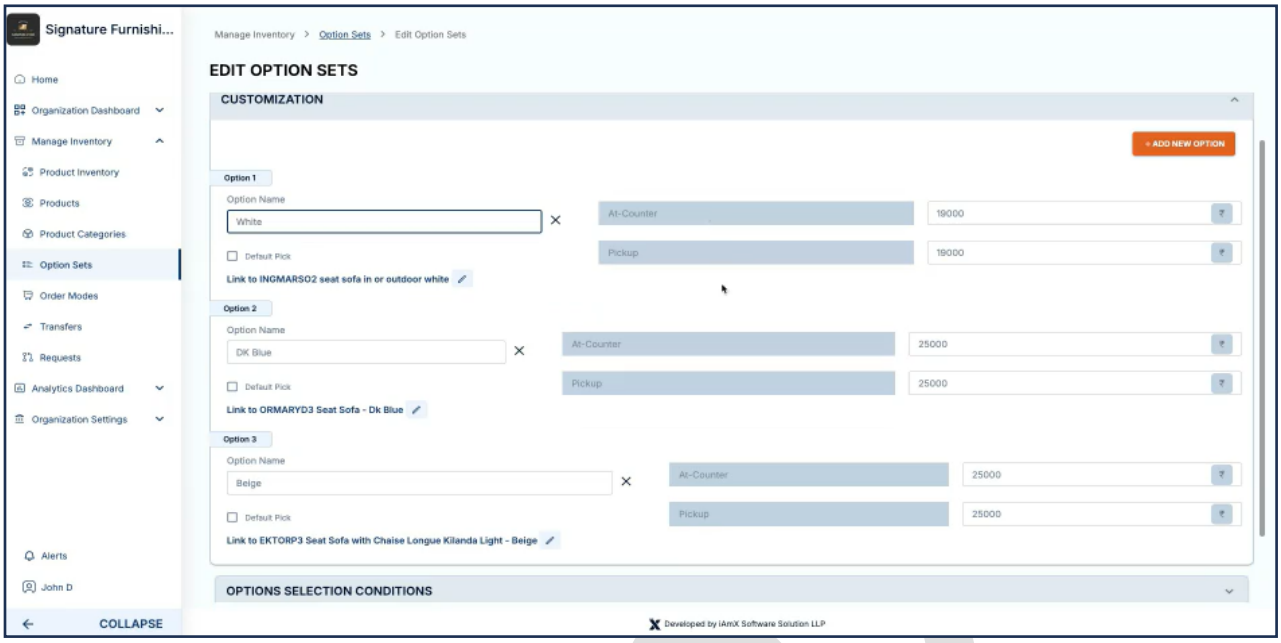
- Effectively manage inventory across multiple locations to fulfil large orders and ensure timely delivery to clients, strengthening business relationships.
- Users can transfer products between regions only if the product is available in the originating store or warehouse. Otherwise, the transfer is not possible.
- Transfers from a store to a warehouse are only possible if the store is linked to that specific warehouse
- Transfers to a central hub from a store or warehouse are not accessible at the store level but are accessible at the organization level of management.
- Users must review transfer details including units, creation date, and product information before accepting the transfer.



➢ Option-Sets:

- Instead of listing each possible combination as separate products, the User can use option sets to organize them
- To customize the product, the user can create combinations with option sets.
- User can track inventory for each specific variation while creating a combination in software.
- Since the product is already assigned to the store, users can see the available products in the "Manage Inventory" section. They can then choose a product and create a combo using the Option Set feature.
- Users can create as many combinations as they require.

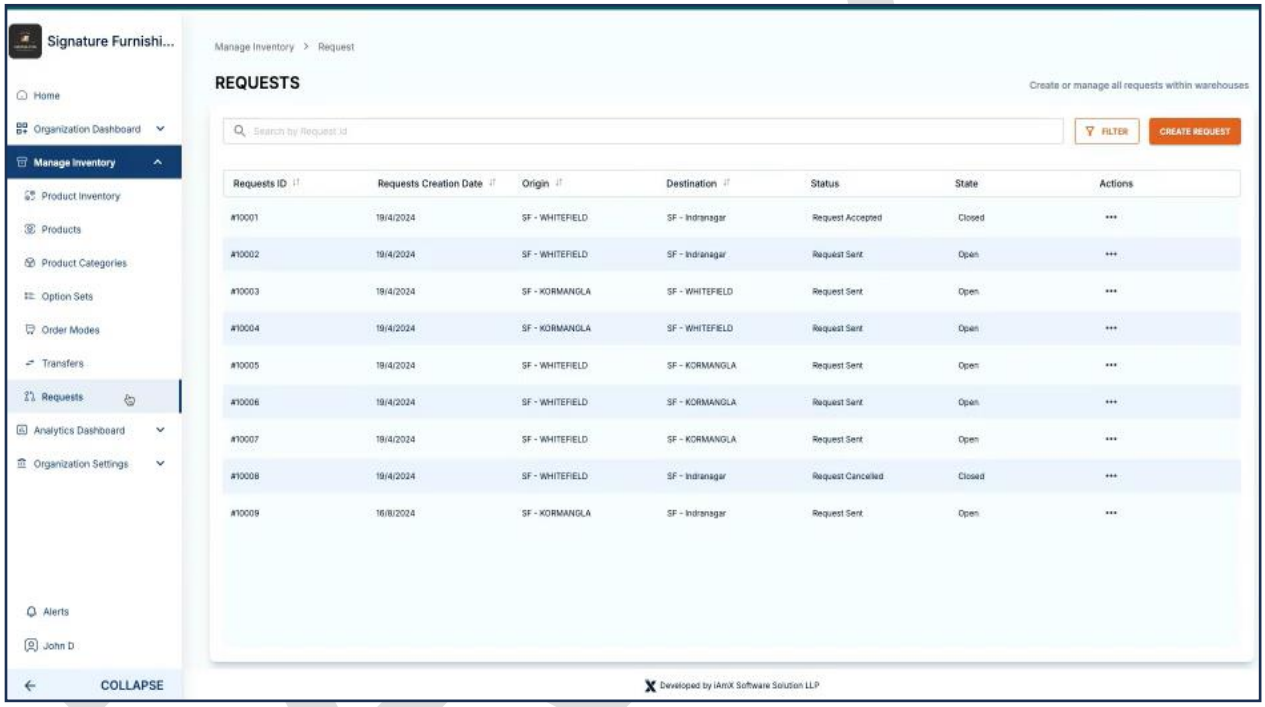




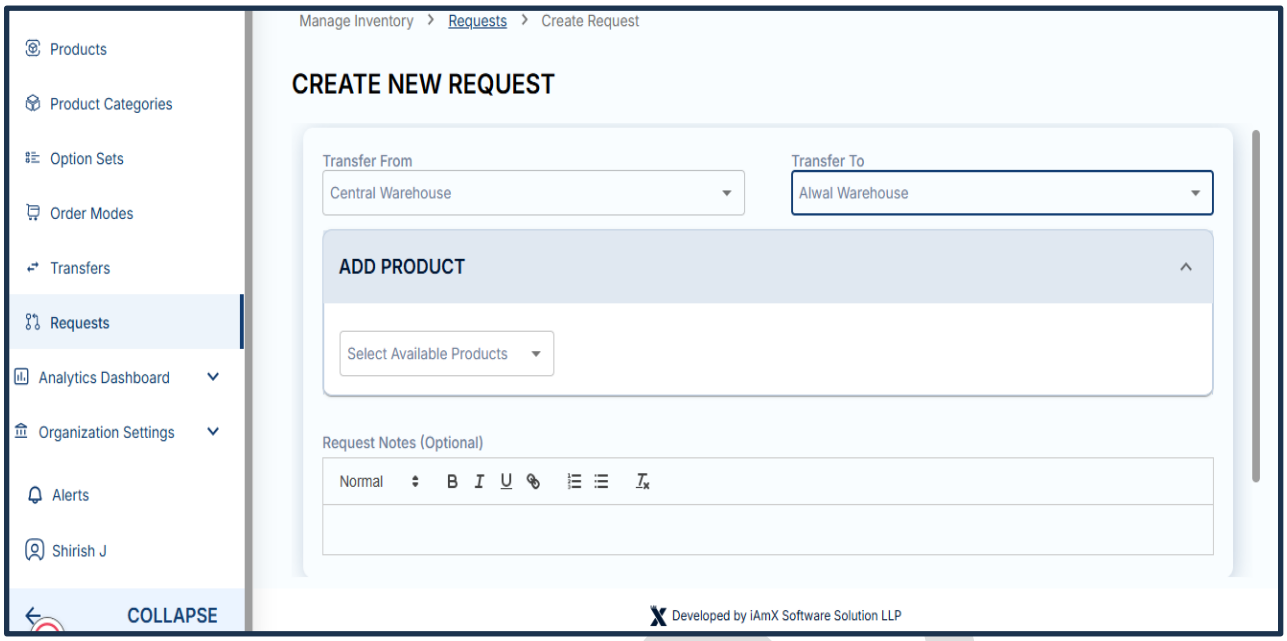
- **Option selection conditions**
  - If the minimum selection quantity is “0” then option sets become optional while placing an order
  - If the minimum selection quantity is “1” or more, then option sets become mandatory while placing an order
  - If the maximum selection quantity is “1” then the option set buttons will be displayed in radio buttons
- This system empowers retailers to manage product options effectively. Making some options optional streamlines checkout for customers who only want the basics
- Requiring other options ensures complete orders for customizable products, reducing processing delays and errors. Using radio buttons for single-choice options simplifies the customer experience and prevents conflicting selections, leading to fewer returns and happier customers.
- This ultimately improves efficiency and boosts sales for the retailers

➢ Manage Requests:

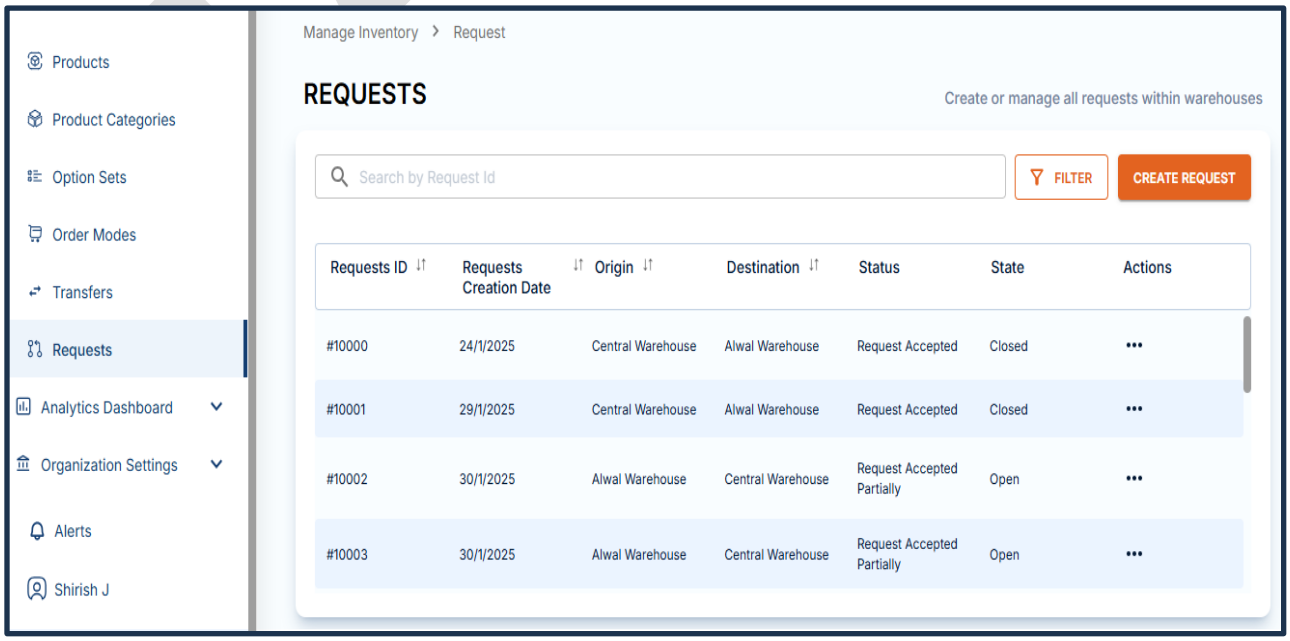
- Users can track their transfer requests in the "Manage Inventory" section
- iAmX allows our users to track and manage their requests, including approvals, all within the software system
- Users can easily track their transfers and requests within the software, eliminating the need for external tracking methods



- Instead of manually checking stock levels and creating orders, users can easily submit product requests through the software. This saves time and reduces the risk of errors
- When creating a product request, users can view available products in the Manage Inventory section and request transfers between stores, from a warehouse to a store, or from a store to a warehouse
- Users with organizational-level access can manage inventory at that level and can manage to submit requests and approve requests within iAmX



- iAmX software provides a central platform for tracking all product requests, whether for replenishment, transfers, or special orders. This allows retailers to monitor the status of each request, ensuring timely fulfilment and preventing delays
- By analyzing product request data, retailers can identify trends and predict future demand. This helps them make informed decisions about purchasing and inventory management, optimizing stock levels and maximizing sales
- The iAmX system shows past requests with the date, request ID, and status (accepted or sent). It also mentions that if the request is closed, in process, or delayed

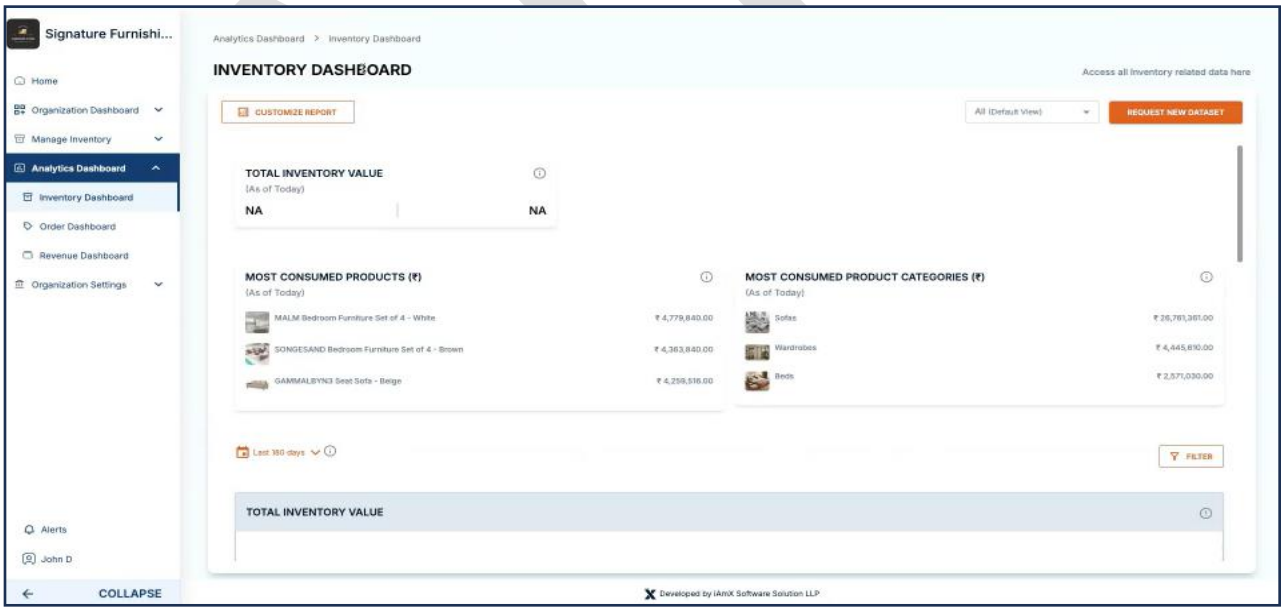


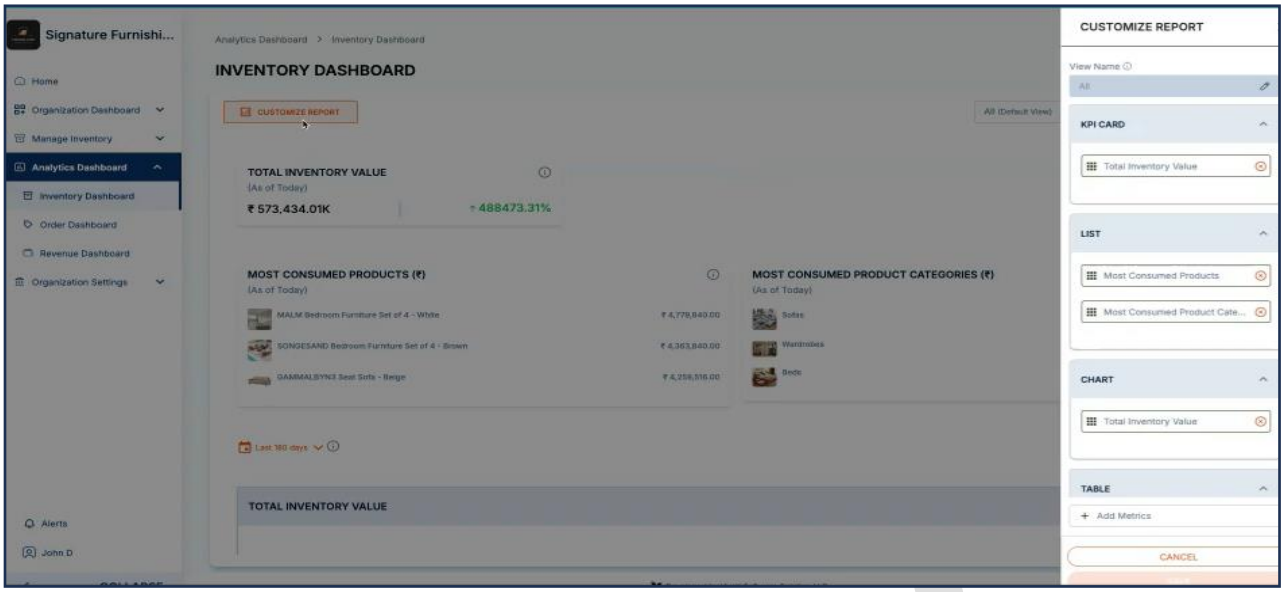
➢ Chapter 3: Analytics Dashboard

- Analytic dashboard in iAmX is a visual tool that provides a real-time overview of key performance indicators (KPIs) and other important data related to the software suite
- The analytics dashboard provides a centralized overview of the store's performance, using charts, graphs, and other visuals for easy understanding
- The analytic dashboard consists of three main sub-dashboards

➢ Inventory Dashboard:

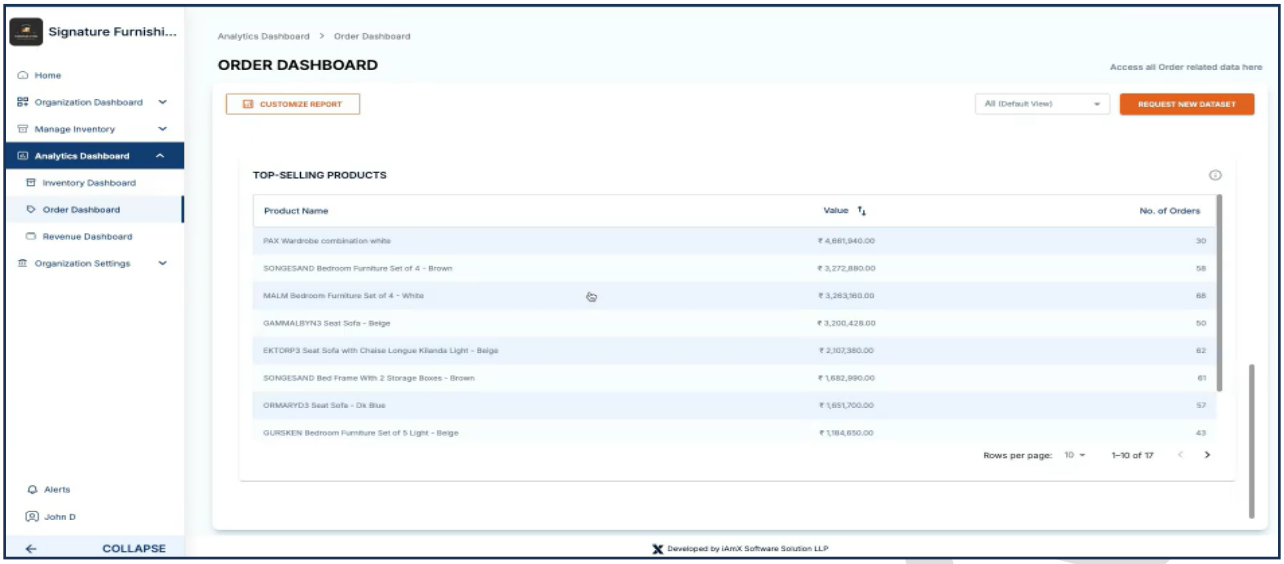
- An inventory dashboard in iAmX is a specialized type of analytics dashboard focused specifically on providing a real-time overview of your inventory levels and related metrics
- It's designed to give you a quick and clear picture of what you have in stock, where it is, and how it's moving
- Users can easily customize the inventory report and add other available metrics





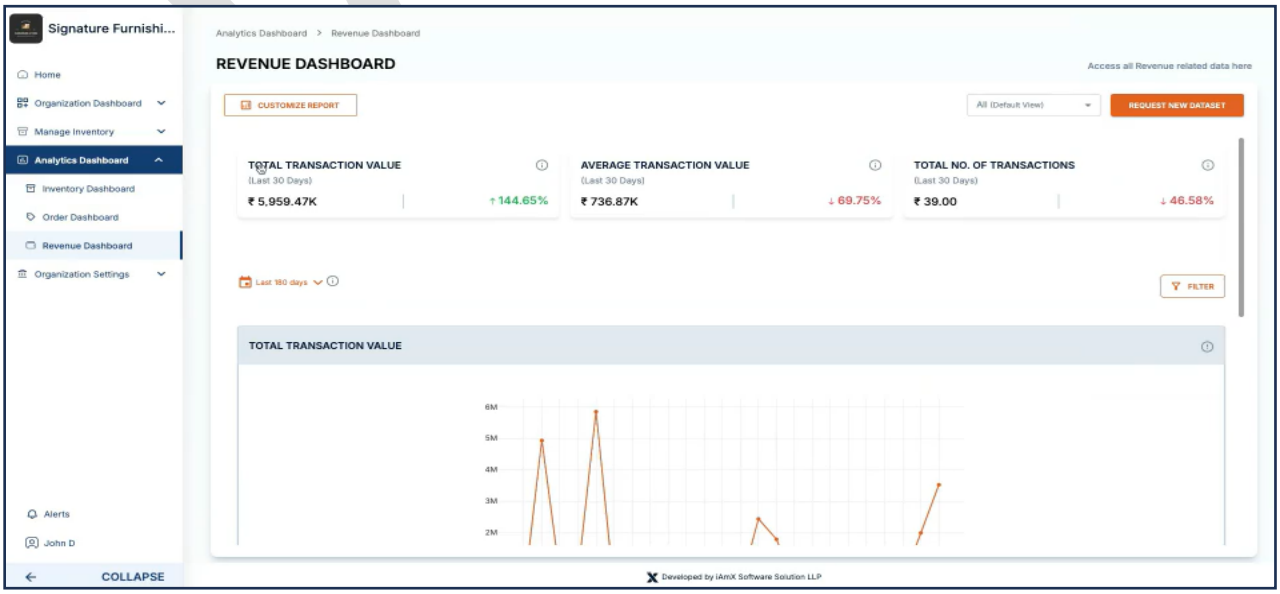
➢ Order Dashboard:

- An order dashboard in iAmX provides a centralized view of all order-related information, giving you a real-time snapshot of the order lifecycle from placement to fulfillment
- It's a crucial tool for managing customer orders efficiently and ensuring smooth operations.
- Detailed information about each order, including order number, customer name, order date, items ordered, quantities, prices and billing address.
- iAmX order dashboards include basic reporting features, allowing users to see trends in order volume, average order value, and other key metrics.
- The iAmX analytics dashboard displays top-selling products and offers filters like order numbers, product availability, and store selection. (How to add order numbers discuss with Sharath)

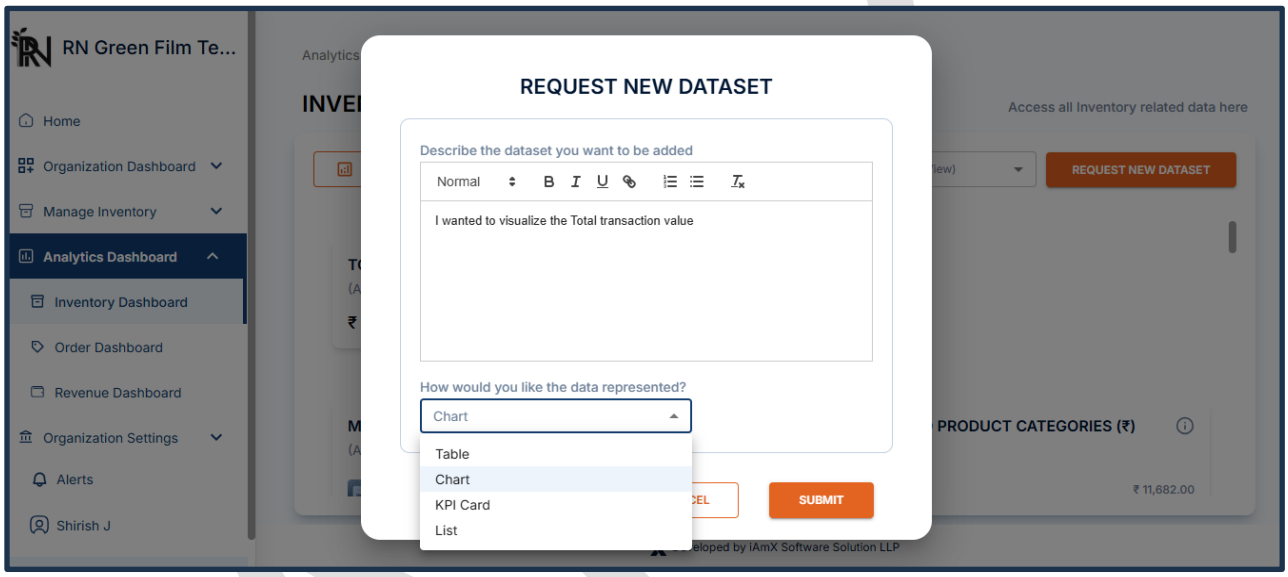


➢ Revenue Dashboard:

- A revenue dashboard in iAmX provides a real-time, high-level view of the store's financial performance, focusing specifically on revenue generation
- The revenue dashboard will display the revenue generated by each store, allowing users to compare performance
- Charts and graphs showing how revenue has changed over time, helping users to identify trends and patterns
- It displays the transaction values like average and total number of transaction values
- The Revenue dashboard includes a filter option allowing users to refine data by order number, product category, and store selection



- Users can request data sets at any time
- This on-demand access provides flexibility and convenience, allowing users to retrieve the specific data they require when they need it
- The ability to request specific data sets within an analytics dashboard is a crucial feature for effective business intelligence
- It empowers users to move beyond pre-built reports and delve into the data that's most relevant to their specific needs at any given moment

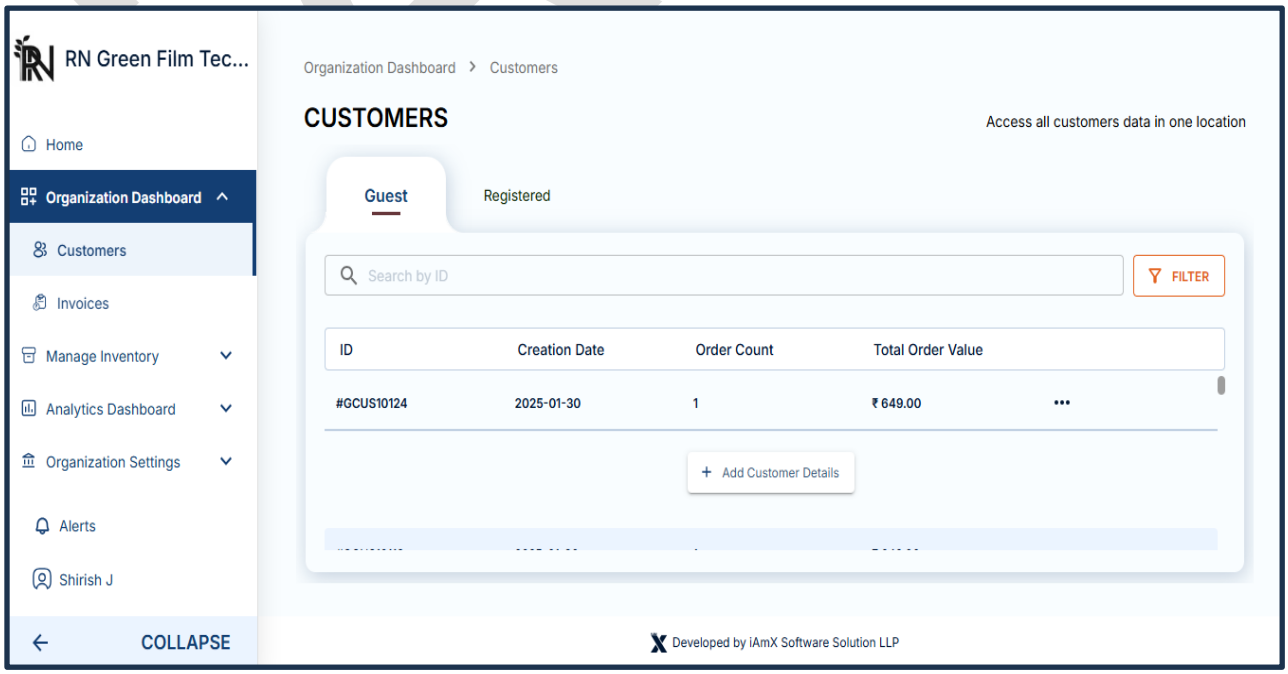


- Users can customize the Analytics dashboard by requesting any data value they wish to visualize
- iAmX allows users to visualize requested data in various formats, including tables, charts, KPI cards, and lists as per the request
- Users can request Inventory, Order, or Revenue data (or any combination of these). Our technical team will process these requests promptly
- This data visualization flexibility empowers users to quickly grasp key insights and tailor data presentation to their specific needs. By choosing this feature users can analyze data more efficiently and communicate findings more effectively

➢ Chapter 4: Organization Dashboard

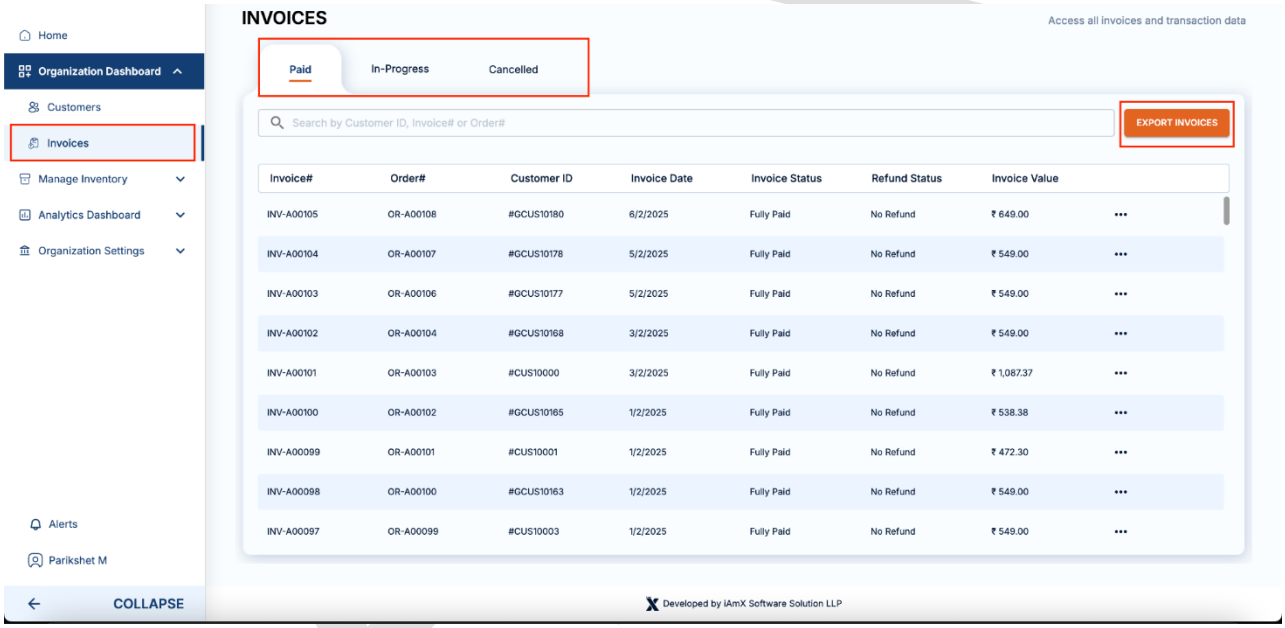
➢ Customers

- This mode in iAmX will track the customer details
- In iAmX, customers are intricately linked, providing valuable insights into sales trends, customer behavior, and overall business performance
- Users can easily view and edit customer details, including those of guest customers
- For registered customers, retailers can view and edit the name, mobile number, email, but cannot edit order count, and order value
- The customer dashboard acts as a central repository for all customer information, including contact details, purchase history, and preferences. This allows for a 360-degree view of each customer.
- The "Customers" option in iAmX goes beyond basic contact management. Detailed customer profiles, including interaction logs, enable personalized service and proactive support.
- Ultimately, the "Customers" option empowers retailers to understand their customer base deeply and create personalized experiences that foster loyalty and boost profitability.



➢ Invoices:

- The Invoices feature allows users to view all customer order transactions and print them as needed
- Invoices are categorized as Paid, IN-Progress, and Cancelled to enhance the user experience.
- Organization dashboard provides a centralized view of customer purchase history (via invoices) enabling businesses to personalize customer interactions, optimize sales strategies, and improve overall customer satisfaction.



- Invoices automate sales tracking, inventory updates, and order management, improving efficiency and reducing errors
- Invoices provide proof of purchase, simplify returns, and offer convenient access to purchase history, boosting customer satisfaction
- Invoices facilitate accurate accounting, simplify tax compliance, and aid in cash flow management, supporting sound financial decisions

Conclusion:

- **iAmX simplifies retail operations:** We offer a comprehensive, integrated platform that streamlines everything from inventory and POS to customer management and reporting
- **iAmX enhances customer understanding:** Gain valuable insights into customer behavior through detailed purchase history, preferences, and demographics, empowering personalized interactions and targeted marketing
- **iAmX drives revenue growth:** Optimize sales strategies, improve customer satisfaction, and increase profitability with our powerful tools and real-time data analysis
- **iAmX is a partner in your success:** We're committed to helping you achieve your business goals and provide ongoing support to ensure you get the most out of our platform
- **iAmX unlocks your business's potential:** We provide the tools and insights you need to thrive in today's competitive retail market
- **iAmX empowers data-driven decisions:** Real-time access to invoice data and customer insights enables you to make informed decisions about pricing, promotions, and inventory management
- **iAmX strengthens customer relationships:** Personalized communication and targeted offers, based on customer purchase history, foster loyalty and drive repeat business
- **iAmX simplifies invoice management:** Automated invoice generation, tracking, and reporting save you time and reduce administrative overhead
- **iAmX improves cash flow:** Efficient invoice management and payment tracking help you optimize your cash flow and ensure timely payments
